**Management Information Base
for the Internet Protocol (IP)
draft-ietf-ipv6-rfc2011-update-10.txt**

Status of this Document

This document is an Internet-Draft and is in full conformance with all provisions of [Section 10 of RFC2026](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at
<http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at
<http://www.ietf.org/shadow.html>.

This document is a product of the IPv6 MIB Revision Design Team. Comments should be addressed to the authors, or the mailing list at ipng@sunroof.eng.sun.com.

Abstract

This memo defines a portion of the Management Information Base (MIB) for

use with network management protocols in the Internet community. In particular, it describes managed objects used for implementations of the Internet Protocol (IP) in an IP version independent manner. This memo obsoletes RFCs 2011, 2465 and 2466.

[1. The Internet-Standard Management Framework](#)

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to [section 7](#) of RFC [3410](#) [9].

Managed objects are accessed via a virtual information store, termed the

Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is

Routhier, Editor

[Section 1.](#) [Page 2]

compliant to the SMIV2, which is described in STD 58, [RFC 2578](#) [1], STD 58, [RFC 2579](#) [2] and STD 58, [RFC 2580](#) [3].

2. Revision History

One of the primary purposes of this revision of the IP MIB is to create a single set of objects to describe and manage IP modules in an IP version independent manner. Where RFCs 2465 and 2466 created a set of objects independent from [RFC2011](#) this document merges those three documents into a single unified set of objects. The `ipSystemStatsTable` and `ipIfStatsTable` tables are examples of updating objects to be independent of IP version. Both of these tables contain counters to reflect IP traffic statistics that originated in much earlier MIBs and both include an IP address type in order to separate the information based on IP version.

Another purpose of this document is to increase the manageability of a node running IPv6 by adding new objects. Some of these tables, such as `ipDefaultRouterTable`, may be useful on both IPv4 and IPv6 nodes while others, such as `ipv6RouterAdvertTable`, are specific to a single protocol.

```
-- RFC Editor
-- The remainder of this section (up to the section header "Overview")
-- is to be removed before publication.

```

Changes from [draft-ietf-ipv6-rfc2011-update-09.txt](#)

May 2004

Renamed `icmpNeutralMsg` to `icmpMsgStats` and `icmpNeutralTable` et al to `icmpStats` et al.

Corrected the OID of `icmpMsgStatsTable` to 30 from 28.

Changes from [draft-ietf-ipv6-rfc2011-update-08.txt](#)

April 2004

Renamed `ipv4IfTableLastChange` and `ipv6IfTableLastChange` to `ipv4InterfaceTableLastChange` and `ipv6InterfaceTableLastChange` for consistency with other names.

Renamed `inetNetToMedia` to `ipNetToPhysical` in order to avoid conflicts with either the INET TC module or the previous versions of the NetToMedia table.

Routhier, Editor

[Section 2](#). [Page 3]

Renamed `inetIcmp` to `icmpNeutral` in order to avoid conflicts with either the INET TC module or the previous versions of the `icmp` objects.

Renamed `icmpGroup2` to `icmpNeutralGroup` to bring it in line with the previous change.

Changes from [draft-ietf-ipv6-rfc2011-update-07.txt](#)

April 2004

Modified `ipv4InterfaceAdminStatus` and `ipv6InterfaceAdminStatus` to be `ipv4InterfaceEnableStatus` and `ipv6InterfaceEnableStatus`

Removed `ipv6InterfacePhysicalAddress` and skipped over it's OID

Corrected the descriptions for `ipIfStatsHCOutMcastOctets` and `ipSystemStatsHCOutMcastOctets` to be for octets transmitted rather than for octets received.

Modified the OIDs for `inetIcmpTable` and `inetIcmpMsgTable` to skip OIDs `{icmp 27}` and `{icmp 28}`

Changed `ipNetToMediaGroup` to `inetNetToMediaGroup`

Modifications per IESG review comments:

Removed mention of invalid prefixes from `ipIfStatsInAddrErrors`.

Removed mention of "unique on link" from `ipv6InterfaceIdentifier`.

Removed the "wellknown(3)" enum from the `IpAddressOriginTC`, but didn't modify other values.

Changes from [draft-ietf-ipv6-rfc2011-update-06.txt](#)

February 2004

Removed the (0..128) constraint on ipAddressPrefixLength as a better constraint, (0..2040) the maximum number of bits, has been added to the TC.

Removed the comment characters on the syntax restriction for the ipAddressRowStatus instance in the compliance statement.

Changes from [draft-ietf-ipv6-rfc2011-update-05.txt](#)

Routhier, Editor

[Section 2.](#) [Page 4]

January 2004

Minor typographical updates.

Removed `ipIfStatsOutNoRoutes` and updated `ipSystemStatsOutNoRoutes` to remove the description of `ipIfStatsOutNoRoutes`.

Added a size constraint on `ipv6InterfacePhysicalAddress`, `inetNetToMediaPhysAddress` and `ipNetToMediaPhysAddress`.

Added a value constraint on `ipAddressPrefixLength`

Added text to explain why `ipNetToMediaIfIndex` and `ipNetToMediaNetAddress` have a max access value of read-create rather than not-accessible.

Modified several objects to use a syntax of `Integer32` instead of `INTEGER`: `ipDefaultTTL` and `ip6DefaultHopLimit`.

Added the suffix 'TC' to `IpAddressPrefixOriginTC`, `IpAddressOriginTC`, `IpAddressStatusTC`, and `ipv6InterfaceIdentifierTC` to separate them from the objects of the similar name.

Modified 'Multi-Stack Implementations' to remove the mention of communities and to add the Context table.

Updated the revision stamps in the MIB.

Added a units clause to `ipReasmTimeout`.

Modified `ip6Forwarding` and `ip6DefaultHopLimit` to be `ipv6IpForwarding` and `ipv6IpDefaultHopLimit`.

Added text to all of the objects with syntax `InetAddress` specifying which object determines the type of their addresses.

Added text to the description of the stats tables and to the compliance statements of the HC groups to reinforce that the 32 bit counters are the low order 32 bits of the 64 bit counters and that the 32 bit counters are required even if the 64 bit counters are included.

Added text suggesting that the spinlocks be the first varbind for their objects in a PDU.

Specified that if ipAddressStorageType is permanent, no other objects in the row are required to be able to be modified.

Added text to `ipAddressTable` to describe the philosophy behind objects being read-only or read-create.

Added a reference clause to `inetNetToMediaTable`.

Added `inetNetToMediaRowStatus` and a defval to `inetNetToMediaType`.

Added some text to `ipv6RouterAdvertMinInterval` to try and clear up its minimum value.

Added test to `ipv6RouterAdvertRowStatus` describing when a row can go active.

Added text to `ipMIBCompliance2` to make it clear that the required address sizes match the required address types.

Made MIN-ACCESS for `ipAddressSpinLock` be not-accessible.

Tagged the syntax for `ipAddressRowStatus` as 'active(1)' the compliance statement.

Added description of zero to `ipv6InterfaceIdentifier` and `ipAddressPrefixLength`.

Added a informative references for the address architecture document in the scope zone table.

Modified `ipv6RouterAdvertCurHopLimit` to refer to www.iana.org.

Added IPR statement.

Added `ipAddressTable` to the security section.

Added `OutFrag0ks` to the case diagram and a note describing the intended relationship between the various fragment counters.

Changes from [draft-ietf-ipv6-rfc2011-update-04.txt](#)

December 2003

Corrected descriptive text for inetIcmpOutMsgs. It was referring to messages received, it now refers to messages sent.

Modified several objects to use InetVersion instead of InetAddressType. These objects were using the address type to specify a version and can now make use of the more specific TC. Changed ipSystemStatsAFType to ipSystemStatsIPVersion, changed ipIfStatsAFType to ipIfStatsIPVersion, changed inetIcmpAFType to

Routhier, Editor

[Section 2](#). [Page 6]

inetIcmpIPVersion and inetIcmpMsgAFType to inetIcmpMsgIPVersion.

Modified the ipAddressTable to allow entries to be created or modified. This entailed the addition of ipAddressSpinLock, ipAddressRowStatus and ipAddressStorageType objects. Also ipAddressIfIndex, ipAddressType and ipAddressStatus were made read-create.

In the case diagram moved the incrementing of InHdrErrors to occur before the incrementing of InMcastPkts and InBcastPkts.

Moved the broadcast counters into separate groups to allow them to be tagged as required only for systems including IPv4.

Added note 5 to the case diagram describing the desired outcome when counting short packets (header errors vs truncated packets).

Added text to note 2 of the case diagram to specify which discard counter may be incremented.

Clarified text about summing interface levels statistics into system level statistics.

Added ipv6InterfaceForwarding and made the object mandatory. Also included text suggesting that a simple system that doesn't allow forwarding to be enabled on a per-interface basis could set these objects to "forward" and rely on ip6Forwarding to enable or disable forwarding for the system.

Modified the size restrictions on ipv6InterfaceReasmMaxSize to be (1500..65535).

Added ipv4InterfaceRetransmitTime and made it mandatory for IPv4 entities.

Made ipDefaultRouterIfIndex part of the index for ipDefaultRouterTable.

Changed ipv6ScopeZoneIndexSubnetLocal to ipv6ScopeZoneIndex3.

Modified the size restrictions on ipv6RouterAdvertDefaultLifetime to be (0 | 4..9000).

Added HC counters for InForwDatagrams, InDelivers, OutRequests and OutForwDatagrams.

Modified the text for OutForwDatagrams to allow for forwarding of locally generated packets. Also added a note to the Case diagram

mentioning that the forwarding counters may be incremented even if the packets are generated by or destined for the local host.

Added references for the router selection draft and the update to 2096.

Removed the size constraint on indexes of type InetAddress.

Changed ipDefaultRouterAFTYPE to ipDefaultRouterAddressType

Changes from [draft-ietf-ipv6-rfc2011-update-03.txt](#)

September 2003

Deprecated the ipRoutingDiscards object and add some text to describe why and that the new version specific object can be found in the IP-FORWARD-MIB.

Modified the syntax for ipIfStatsIfIndex to be InterfaceIndex instead of InterfaceIndexOrZero as we no longer need the capability of using zero within the index. (The MIB originally used a zero index to specify the system level statistics.)

Added a description clause to the ipAddressGroup object.

Added the ipLastChangeGroup to ipMIBCompliance2 with a description of optional.

Changed [draft-ietf-ipngwg-addr-arch-v3-11.txt](#) to [RFC3513](#).

Changes from [draft-ietf-ipv6-rfc2011-update-02.txt](#)

June 2003

Removed the ipv4 and ipv6 only requirements on the ipSystemStatsAFTYPE and ipIfStatsAFTYPE objects. Instead added a

pseudo compliance statement requiring only global ipv4 and ipv6 types for those two objects as well as inetIcmpAFType and inetIcmpMsgAFType.

Added a pseudo compliance statement requiring only global ipv4 and ipv6 types for ipAddressPrefixType.

Added a pseudo compliance statement requiring only global and non global ipv4 and ipv6 types for ipAddressAddrType, inetNetToMediaNetAddressType and ipDefaultRouterAFType

In response to a question about the size constraint on the various InetAddress objects (0..36). I have decided to leave this as is for now. The actually size will be one of 4, 8, 16 or 20 depending on the type in use and the syntax could be reduced to cover those sizes. However using such a small limit might require a new mib if a new address type is added to the InetAddress MIB that uses a larger size. 36 seems to be a reasonable compromise for allowing possible growth but avoiding problems with index length limitations.

May 2003

Restored ipRoutingDiscards to a current object from the deprecated group per discussions with previous MIB authors. The argument to move it to deprecated relied on the fact that it really belongs with the routing group rather than the main IP group. However as it already exists in the IP group and any router must contain the IP group it is not reasonable to remove it and create a new object in the routing area simply to adjust where the object is rooted in the MIB tree. This object was placed in a new group "ipRoutingGroup" and the group was made mandatory in order to mimic the previous MIB.

Changed the text to use "address type" or "address types" instead of "address family" or "address families" in order to avoid any confusion with the term as used by IANA in the assignment of address family numbers.

Added some text to the description of ipAddressTable to remind users that link-local addresses must use the "ipv6z" type.

Changes from [draft-ietf-ipv6-rfc2011-update-01.txt](#)

February 2003

Added ipLastChangeGroup which makes the lastChange objects a SHOULD for agents that have the proper values available.

Added normative references for IMPORTed mibs.

January 2003

Editorial cleanup.

Renamed the ipv4If entries to ipv4Interface in order to be similar to the ipv6Interface entries.

Routhier, Editor

[Section 2.](#) [Page 9]

Updated the SNMP boilerplate.

Updated the references to remove many SNMP specific entries and split the remainder into normative and informative.

Updated the security considerations section.

Decided not to add the netmask or BcastAddr information from the deprecated ipAddrTable into the new mib as there was no major support for them.

Removed IPv6 conformance and compliance OIDs as they are no longer in use.

Renamed ipv6Forwarding and ipv6DefaultHopLimit to ip6Forwarding and ip6DefaultHopLimit and moved them from the IPv6 branch to the IP branch, thus removing the last objects in the IPv6 branch.

Added ipv6RouterAdvertSpinLock and ipv6RouterAdvertRowStatus

Added ipv4IfTableLastChange, ipv6IfTableLastChange and ipIfStatsTableLastChange.

Renumbered pretty much everything at the IP branch level in order to rationalize things and fit in the new objects.

Changes from [draft-ops-rfc2011-update-02.txt](#):

October 2002

Renumbered objects in groups that had objects removed from one draft to another. As per SMI rules no objects that have been published in an RFC have been renumbered. The affected areas are: ipv6InterfaceTable, ipIfStatsTable, inetIcmpTable and inetIcmpMsgTable

Split the ipIfStatsTable into two tables under a common OID. The

two tables are ipSystemStatsTable which contains system-wide statistics and ipIfStatsTable which contains interface-specific statistics. The same counters are available from both tables.

The compliance and conformance section was rebuilt. ipGroup2 was renamed to ipv4GeneralGroup and ipReasmTimeout was added to it. The following groups were created: ipv4IfGroup, ipv6Ifgroup, ipSystemStatsGroup, ipSystemStatsHC0ctetGroup, ipSystemStatsHCPacketGroup, ipIfStatsGroup, ipIfStatsHC0ctetGroup, ipIfStatsHCPacketGroup, ipAddressPrefixGroup, ipAddressGroup, ipNetToMediaGroup, ipDefaultRouterGroup, ipv6RouterAdvertGroup and

icmpGroup2. The compliance section allows a compliant agent to provide read-only access to all of the nominally read-write objects.

Many minor changes to deal with errors found from mib compilers.

Changed the indexing from inetNetToMediaEntry to use a local copy of the ifIndex.

Import InetZoneIndex for use a scope index. Previously this was the ScopeIdentifier TC defined within this document. Also change the naming convention for scopes to use index instead of identifier.

Close several issues without changes:

Should we include an object or objects to express the capability of an implementation with respect to items like extension headers for IPv6. I have decided to not include such objects. I believe that we should wait for some deployment experience to see if such objects would be useful and to determine their proper granularity.

Are there other items that could be added to the ipv{4 6}IfTables such as (for v4) directed broadcast, proxy arp, header compression, broadcast address and arp cache timeout. As I receive only one request for such objects I have not added them.

Is there a better SMI data type for the lifetime objects in the ipAddressPrefixTable, ipDefaultRouterTable and ipv6RouterAdvertTable. I don't think there is a better SMI data type. We could generate some TCs for them (there are several classes of lifetime) but I don't think that would be useful.

There was a note in the v6 interface table suggesting that some of the objects could be removed. I think we have now removed all of those objects and don't intend to remove more without comments.

Should the ipv6ScopeZoneIndexTable include associated objects to provide a scope description similar to ipMRouteScopeNameString ([rfc2932](#))?

My current decision is to NOT add such an object or set of objects. Should the ipv6AddressIfIdentifier be dropped? I think this provides some utility in specifying the how addresses are formed (at least some of them). There is also the further question of moving the Ipv6AddressIfIdentifier TC somewhere else. I don't think it is completely an EUI and therefore it should have a TC somewhere other than the IF-MIB and here seems reasonable.

Any other objects from ipv6IfTable that we need? I don't think so.

Are there other possible sources for ipAddressPrefixOrigin? No additions were suggested and no action was taken.

Changes from [draft-ops-rfc2011-update-00.txt](#):

May 2002

Removed ipv6InterfaceEffectiveMtu and
ipv6InterfaceIdentifierLength.

Added text to ipAddressPrefixTable to describe its utility.

Added text to ipAddressTable to state that multicast addresses are described in their own table(s).

Added ipv4IfAdminStatus and ipv6InterfaceAdminStatus.

Added text to ipAddressPrefixOrigin to describe that an address becomes well known by assignment from IANA or the address registries or by specification in a standards track RFC.

Added text to ipAddressOrigin to clarify the manual vs random difference.

Added text to inetNetToMediaType to clarify the difference between static and local.

Created textual conventions for the following IpAddressOrigin, IpAddressStatus and IpAddressPrefixOrigin.

Added persistence information to all read-write and read-create objects:

ipForwarding & ipDefaultTTL - should be persistent

ipv6Forwarding, ipv4AdminStatus & ipv6InterfaceAdminStatus - SHOULD be persistent

ipv6InterfaceIdentifier - modified from RW to Read-only

ipNetToMediaPhysAddress & ipNetToMediaType - should not be persistent

inetNetToMediaPhysAddress & inetNetToMediaType - SHOULD NOT be persistent

Added text to specify that ifIndex objects (ipv4IfIndex, ipv6InterfaceIfIndex, ipIfStatsIfIndex, ipAddressPrefixIfIndex, ipAddressIfIndex and ipv6ScopeIdIfIndex) use the same indexes as ifIndex.

Removed ifIndex and code from the descriptions of inetIcmpMsg{In Out}Pkts.

Updated the text for the objects in the ipIfStatsTable. The new text allows them to be either system wide or interface specific. It also clarifies which interface should be used for some objects. Finally descriptions were added to some newer objects.

Added ipIfStatsRefreshRate

Modified the author information. The main author list has been moved to a section within the document and replaced on the front page with the editor's name. The MIB contact information has been modified.

Added text mentioning that ARP ([RFC826](#)) and ND ([RFC2461](#)) are the two most likely ways of populating the Net to Media table.

Added a reference clause to inetIcmpMsgType pointing to the IANA pages for ICMP and ICMPv6 parameters.

Added text mentioning that ipIfStatsInTooBigErrors is only valid for IPv6 but that it should be instantiated for IPv4 as well.

Added text to the ipAddressPrefixTable and it's objects mentioning that it isn't tuned for IPv4 and defaults to use for IPv4 addresses.

Added the ipAddressLastChanged object.

Added reference clauses to ipv6DefaultHopLimit and several objects in the ipAddressPrefix table. I don't think that any other objects that don't already have some text have something to reference.

Modified the IP statistics table.

ipIfStatsHCInUcastPkts became ipIfStatsHCInReceives

removed ipIfStatsInTooBigErrors and include those packets in
ipIfStatsOutFragFails

added ipIfStatsInForwDatagrams to count packets that we attempt to
forward

clarified the text in `ipIfStatsOutForwDatagrams` to make it clear that "success" was related to the forwarding step and not the transmission step

added `ipIfStatsOutTransmits` and `ipIfStatsHCOutTransmits` as counters of the packets sent to the lower layers and pointed the `OutOctet` counters to them

added `ipIfStatsOutNoRoutes` to count the number of locally generated datagrams that couldn't be transmitted as no route was found

added `ipIfStatsOutFragReqds` to count the number of datagrams that require fragmentation

Added text and a Case diagram describing the statistics table.

Added the `ipAddressCreated` object.

Removed `ipIfStatsHCOutUcastPkts` as `HCOutTransmits` replaces it.

Also re-arranged the `statsTable` sequence to try and group the objects more rationally.

Added reachable and retransmit times to the `ipv6InterfaceTable`

Added Default router list.

Added router advertisement configuration table.

November 2001

Modified the ICMP message table to remove some indexes. The table no longer tracks counters with per-interface or per-ICMP code granularity.

[12](#) Jul 2001

Changed to IPNG working group work item.

Removed mention of SIIT, since it's just for transition

Added lots of counters to ipIfStats table, and
ipIfStatsDiscontinuityTime

Changed ipAddressIfIndex and ScopeIdentifier to refer to IF-MIB
instead of [RFC 2863](#) or [RFC 2233](#)

Removed text about agents supporting a subset of values from
ipv6Forwarding; this belongs in an AGENT-CAPABILITIES.

Un-deprecated ipReasmTimeout. XXX Do we need ipv6ReasmTimeout too?
I think not; [RFC2460](#) seems to say that it's a constant 60 seconds.

Changes from first draft posted to v6mib mailing list:

[23 Feb 2001](#)

Added ipv4InterfaceTable

Added ipv6InterfaceTable

Added ipAddressPrefixTable and slightly reworked ipAddressTable
(nee inetAddressTable).

Deprecated ipMIBCompliance. Still need to finish updated ones.

Added copyright and table of contents.

[7 Feb 2001](#)

Renamed inetIfStats to ipIfStats

Added ipv6ScopeTable

Added ScopeIdentifier TC, which should be in INET-ADDRESS-MIB.

Added SIZE to inetAddrAddr and inetNetToMediaAddress

Wrote some boilerplate for multi-interface-or-system-wide counter
tables.

[3. Overview](#)

3.1. Multi-Stack Implementations

This MIB does not provide native support for implementations of multiple stacks sharing the same address type. One option for supporting such designs is to assign each stack within an address type to a separate context. These contexts could then be selected based upon the context name, with the Entity MIB and VACM Context Table providing methods for listing the supported contexts.

3.2. Discussion of Tables and Groups

This MIB is composed of a small number of discrete objects and a series of tables meant to form the base for managing IPv4 and IPv6 entities.

While some of the objects are meant to be included in all entities some of the objects are only conditionally mandatory. The unconditionally mandatory objects are mostly counters for IP and ICMP statistics. The conditionally mandatory objects fall into one of several groups: objects for use in higher bandwidth situations, objects for use with IPv4, objects for use with IPv6 and objects for use on IPv6 routers. In short it is not expected that every entity will implement all of the objects within this MIB. The reader should consult the conformance and compliance section to determine which objects are appropriate for a given entity.

3.2.1. General Objects

In both IPv4 and IPv6 there are only a small number of "knobs" for controlling the general IP stack. Most controls will be in a more specific setting, such as for controlling a router or TCP engine.

This MIB defines a total of three general knobs only two of which are used for both IPv4 and IPv6.

Objects are included for both protocols to enable or disable forwarding and to set limits on the lifetime of a packet (ttl or hop count).

The third knob, the timeout period for reassembling fragments, is only defined for IPv4 as IPv6 specifies this value directly.

Each group of objects is required when implementing their respective protocols.

3.2.2. Interface Tables

This MIB includes a pair of tables to convey information about the IPv4

and IPv6 protocols that is interface specific.

Special note should be taken of the administrative status objects. These are defined to allow each protocol to selectively enable or disable interfaces. These objects can be used in conjunction with the ifAdminStatus object to manipulate the interfaces as necessary. With these three objects an interface may be enabled or disabled completely as well as connected to the IPv4 stack, the IPv6 stack or both stacks. Setting ifAdminStatus to "down" should not affect the protocol specific

status objects.

Each interface table is required when implementing their respective protocols.

3.2.3. IP Statistics Tables

The IP statistics tables (`ipSystemStatsTable` and `ipIfStatsTable`) contain objects to count the number of datagrams and octets that a given entity has processed. Unlike the previous attempt this document uses a single table for multiple address types. Typically the only two types of interest are IPv4 and IPv6; however the table can support other types if necessary.

The first table, `ipSystemStatsTable`, conveys system wide information. (That is, the various counters are for all interfaces and not a specific set of interfaces.) Its index is formed from a single sub-id that represents the address type for which the statistics were counted.

The second table, `ipIfStatsTable`, conveys interface specific information. Its index is formed from two sub-ids. The first represents the address type (IPv4 and IPv6) and the interface within that address type is represented by the second sub-id.

The two tables have a similar set of objects which are intended to count the same things except for the difference in granularity. The object ID "`ipSystemStatsEntry.2`" is reserved in order to align the object ids of the counters in the first table with their counterparts in the second table.

Several objects of note are `ipSystemStatsDiscontinuityTime`, `ipIfStatsDiscontinuityTime`, `ipSystemsStatsRefreshRate` and `ipIfStatsRefreshRate`. These objects provide information about the row in the table more than about the system itself.

The discontinuity objects allow a management entity to determine if a discontinuity event which would invalidate the management entity's understanding of the counters has occurred. The system being re-initialized or the interface being cycled are possible examples of a

discontinuity event.

The refresh objects allow a management entity to determine a proper polling interval for the rest of the objects.

The following Case diagram represents the general ordering of the packet counters. In order to avoid extra clutter the prefixes "ipSystemStats" and "ipIfStats" have been removed from each of the counter names.

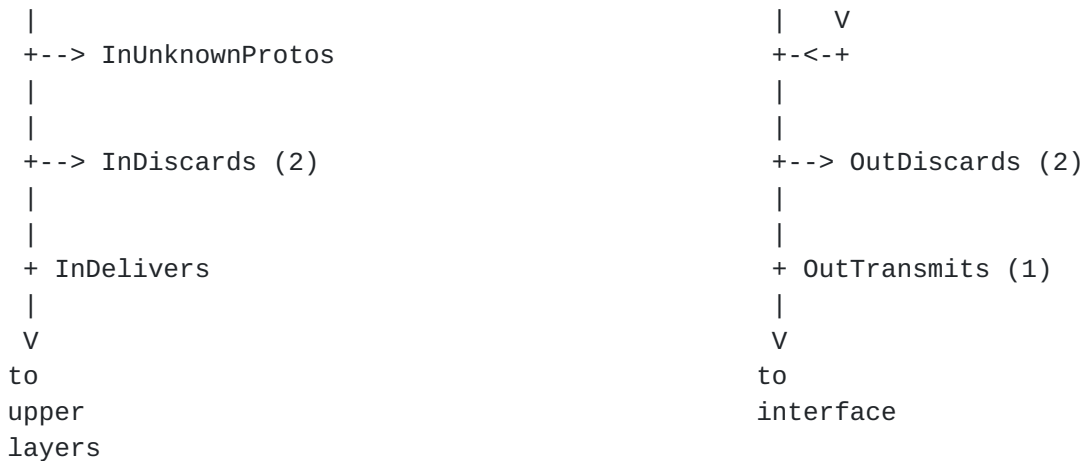

from		from
interface		upper
		layers
V		V

+>-+ OutBcastPkts (1)

Routhier, Editor

[Section 3.2.3.](#) [Page 18]

(1) The HC counters and octet counters are also found at these points but have been left out for clarity.

(2) The discard counters may increment at any time in the processing path. Packets discarded to the left of InNoRoutes cause the InDiscards counter to increment while those discarded to the right are counted in the OutDiscards counters.

(3) Local packets on the input side are counted on the interface associated with their destination address, which may not be the interface on which they were received. This requirement is caused by the possibility of losing the original interface during processing, especially re-assembly.

(4) Some re-assembly algorithms may lose track of the number of fragments during processing and so some fragments may not be counted in this object.

(5) InTruncatedPkts should only be incremented if the frame contained a valid header but was otherwise shorter than required. Frames that are too short to contain a valid header should be counted as InHdrErrors.

(6) The forwarding objects may be incremented even for packets that were originated locally or are destined for the local host if their addresses are such that the local host would need to forward the packet to pass it to the correct interface.

(7) When fragmenting a packet an entity should increment the OutFragFails counter rather than the OutDiscards counter in order to preserve the equation $\text{FragOks} + \text{FragFails} == \text{FragRqds}$.

The objects in both tables are spread amongst several conformance groups based on the bandwidth required to wrap the counters within an hour. The base system group is mandatory for all entities. The other system

groups are optional depending on bandwidth. The interface specific-groups are optional.

3.2.4. Internet Address Prefix Table

This table provides information about the prefixes that this entity is using including their lifetimes. This table provides a convenient place to which other tables that make use of prefixes, such as the `ipAddressTable`, may point. By including this table the MIB can supply the prefix information for all addresses yet minimize the amount of duplication required in storing and accessing this data. This arrangement also makes the relationship between addresses that have the same prefix clear.

This table is required for IPv6 entities.

3.2.5. Internet Address Table

This table lists the IP addresses (both IPv4 and IPv6) used by this entity. It also includes some basic information about how and when the address was formed and last updated. This table allows a manager to determine who a given entity thinks it is.

This table is required for all IP entities.

3.2.6. Internet Address Translation Table

This table provides a mapping between IP layer addresses and physical addresses as would be formed by either ARP for IPv4 or the neighbor discovery protocol for IPv6.

3.2.7. IPv6 Scope Zone Index

This table specifies the zone index to interface mapping. By examining the table a manager can determine which groups of interfaces are within

a particular zone for a given scope.

The zone index information is only valid within a given entity, the indexes used on one entity may not be comparable to those used on a different entity.

This table is required for IPv6 entities.

3.2.8. Default Router Table

This table lists the default routers known to this entity. This table is intended to be a simple list to display the information end nodes may have been configured with or acquired through a simple system such as IPv6 router advertisements. Managers attempting to view more complicated routing information should examine the routing specific tables from other MIBs.

This table is required for all entities.

3.2.9. Router Advertisement Table

This table contains the non-routing information that an IPv6 router would use in constructing a router advertisement message. It does not contain information about the prefixes or other routing specific information that the router might advertise. The router should acquire such information from either the routing tables or from some routing table specific MIB.

This table is only required for IPv6 router entities.

3.2.10. ICMP Statistics Tables

There are two sets of statistics for ICMP. The first contains a simple set of counters to track the number of ICMP messages and errors processed by this entity.

The second supplies more detail about the ICMP messages processed by this entity. Its index is formed from two sub-ids. The first represents the address type (IPv4 and IPv6) and the particular message type being counted is represented by the second sub-id.

Both of these tables are required for all entities.

3.2.11. Conformance and Compliance

This MIB contains several sets of objects. Some of these sets are useful on all types of entities while others are only useful on a limited subset of entities. The conformance section attempts to group the objects into sets that may be discussed as units and the compliance section then details which of these units are required in various circumstances.

The circumstances used in the compliance section are implementing IPv4,

IPv6 or IPv6 router functions and having bandwidth less than 20MB, between 20MB and 650MB or greater than 650MB.

3.2.12. Deprecated Objects

This MIB also includes a set of deprecated objects from previous iterations. They are included as part of the historical record.

4. Updating Implementations

There are several general classes of change that are required.

The first and most major change is that most of the previous objects have different object ids and additional indexes to support the possibility of different address types. The general counters for IP and ICMP are examples of this. They have been moved to the ipSystemStatsTable and icmpMsgStatsTable respectively.

The second change is the extension of all address objects to allow for both IPv4 and IPv6 addresses and the addition of an address type object to specify what address type is in use.

The third change is the addition of several new objects to the replacement for a previously existing table such as ipNetToPhysical.

The fourth change is the addition of completely new tables such as ipIfStatsTable and ipDefaultRouterTable. The first is based on the previous statistics groups while the second is completely new to this MIB.

4.1. Updating an implementation of the IPv4-only IP-MIB

The somewhat more specific changes that are required for IPv4 follow. Note well: this is not meant to be an exhaustive list and the reader should examine the MIB for full details.

Several of the general objects (ipForwarding, ipDefaultTTL, ipReasmTimeout) remain unchanged.

Most of the rest of the general objects were counters and have been moved into the ipSystemStatsTable. The basic instrumentation should remain the same though the object definitions should be checked for any clarifications. If they aren't already in a structure putting the counter variables in one would be useful. Several new objects have been

added to count additional items, instrumentation code must be added for these objects. Finally the SNMP routines must be updated to handle the new indexing.

In addition to the ipSystemStatsTable the MIB includes the ipIfStatsTable. This table counts the same items as the system table but does so on a per interface basis. It is optional and may be ignored. If you decide to implement it you may wish to arrange to collect the data on a per-interface basis and then sum those counters in order to provide the aggregate system level statistics. However if you choose to provide the system level statistics by summing the interface level counters no interface level statistics can be lost - if an interface is removed the statistics associated with it must be retained.

The ipAddrTable has, loosely, been converted to the ipAddressTable. While the general idea remains the same the ipAddressTable is sufficiently different that writing new code may be easier than updating old code. The primary difference is the addition of several new objects. In addition the ipAdEntReasmMaxSize has been moved to another table, ipv4InterfaceTable. As above the SNMP routines will need to be updated to handle the new indexing.

The ipNetToMediaTable has been moved to the ipNetToPhysicalTable. These tables are fairly similar and updating the old code may be straightforward. As above the SNMP routines will need to be updated to handle the new indexing.

Two new tables, ipv4InterfaceTable and ipDefaultRouterTable, are required as well as several new ICMP counters.

Finally there are several tables that are required for IPv6 but are optional for IPv4 that you may elect to implement.

4.2. Updating an implementation of the IPv6-MIB

The somewhat more specific changes that are required for IPv6 follow. Note well: this is not meant to be an exhaustive list and the reader should examine the MIB for full details.

Two of the general objects, `ipv6Forwarding` and `ipv6DefaultHopLimit`, have been renamed and given new object identifiers within the `ip` branch but are otherwise unchanged. The new names are `ipv6IpForwarding` and `ipv6IpDefaultHopLimit`.

While there is an `ipv6InterfaceTable` that contains some of the pieces from the `ipv6IfTable` the two are somewhat different in concept. The `ipv6IfTable` was meant to replicate the `ifTable` while the

ipv6InterfaceTable is meant to be an addition to the ifTable. As such items that were duplicated between the ifTable and ipv6IfTable have been removed and some new objects added.

The ipv6IfStatsTable most closely resembles the ipIfStatsTable with an additional index for the address type and most of the instrumentation should be re-usable. Some new objects have been added to the ipIfStatsTable. As above the SNMP routines will need to be updated to handle the new indexing. Finally the ipIfStatsTable is optional and may be ignored.

The ipSystemStatsTable is effectively new, but it may be able to make use of most of the instrumentation from the old ipv6IfStatsTable. As with the IPv4 discussion one implementation strategy would be to count the statistics for the ipIfStatsTable and aggregate them when queried for this table. Again, as with the IPv4 discussion, this strategy only works if the interfaces can not be removed or if the statistics for removed interfaces are somehow retained.

The ipv6AddrPrefixTable is now the ipAddressPrefixTable. The new table contains an extra object and the additional index required for IPv4 compatibility. As above the SNMP routines will need to be updated to handle the new indexing.

The ipAddressTable is loosely based on the ipv6AddrTable but has changed considerably with the addition of several new objects and the removal of one of its indexes.

The IPv6 routing information (ipv6RouteNumber, ipv6DiscardedRoutes and ipv6RouteTable) has been removed from this MIB. The replacements or updates for this information is in the update to the IP Forwarding Table MIB [16]. The ipv6NetToMediaTable has been converted to the ipNetToPhysicalTable. The new table contains an extra object and the additional index required for IPv4 compatibility. As above the SNMP routines will need to be updated to handle the new indexing.

The ICMP tables have been substantially changed. The previous tables required counting on a per-message and per-interface basis. The new tables only require counting on a per-message per-protocol basis and include an aggregate of all messages on a per-protocol basis.

In addition to the above several new tables have been added. Both the `ipv6ScopeZoneIndexTable` and `ipDefaultRouterTable` are required on all IPv6 entities. The `ipv6RouterAdvertTable` is only required on IPv6 routers.

IpAddressStatusTC ::= TEXTUAL-CONVENTION

STATUS current

DESCRIPTION

"The status of an address. Most of the states correspond to

states from the IPv6 Stateless Address Autoconfiguration protocol [[5](#)].

The preferred(1) state indicates that this is a valid address that can appear as the destination or source address of a packet.

The deprecated(2) state indicates that this is a valid but deprecated address that should no longer be used as a source address in new communications, but packets addressed to such an address are processed as expected.

The invalid(3) state indicates that this isn't a valid address and it shouldn't appear as the destination or source address of a packet.

The inaccessible(4) state indicates that the address is not accessible because the interface to which this address is assigned is not operational.

The unknown(5) state indicates that the status can not be determined for some reason.

The tentative(6) state indicates the uniqueness of the address on the link is being verified. Addresses in this state should not be used for general communication and should only be used to determine the uniqueness of the address.

The duplicate(7) state indicates the address has been determined to be non-unique on the link and so must not be used.

In the absence of other information, an IPv4 address is always preferred(1)."

ipIfStatsHCInOctets OBJECT-TYPE

SYNTAX Counter64

MAX-ACCESS read-only

Routhier, Editor

[Section 5.](#) [Page 56]

STATUS current

DESCRIPTION

"The total number of octets received in input IP datagrams, including those received in error. This object counts the same octets as ipIfStatsInOctets but allows for larger values.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ipIfStatsDiscontinuityTime."

::= { ipIfStatsEntry 6 }

ipIfStatsInHdrErrors OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of input IP datagrams discarded due to errors in their IP headers, including version number mismatch, other format errors, hop count exceeded, errors discovered in processing their IP options, etc.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ipIfStatsDiscontinuityTime."

::= { ipIfStatsEntry 7 }

ipIfStatsInNoRoutes OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of input IP datagrams discarded because no route could be found to transmit them to their destination.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ipIfStatsDiscontinuityTime."

::= { ipIfStatsEntry 8 }

ipIfStatsInAddrErrors OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION

"The number of input IP datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., ::0). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of
ipIfStatsDiscontinuityTime."

::= { ipIfStatsEntry 9 }

ipIfStatsInUnknownProtos OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of locally-addressed IP datagrams received successfully but discarded because of an unknown or unsupported protocol.

When tracking interface statistics the counter of the interface to which these datagrams were addressed is incremented. This interface might not be the same as the input interface for some of the datagrams.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of
ipIfStatsDiscontinuityTime."

::= { ipIfStatsEntry 10 }

ipIfStatsInTruncatedPkts OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of input IP datagrams discarded because the datagram frame didn't carry enough data.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ipIfStatsDiscontinuityTime."

```
::= { ipIfStatsEntry 11 }
```

ipIfStatsInForwDatagrams OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of input datagrams for which this entity was not their final IP destination and for which this entity attempted to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those datagrams which were Source-Routed via this entity, and the Source-Route processing was successful.

When tracking interface statistics the counter of the incoming interface is incremented for each datagram.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of
ipIfStatsDiscontinuityTime."

::= { ipIfStatsEntry 12 }

ipIfStatsHCInForwDatagrams OBJECT-TYPE

SYNTAX Counter64

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of input datagrams for which this entity was not their final IP destination and for which this entity attempted to find a route to forward them to that final destination. This object counts the same packets as ipIfInForwDatagrams but allows for larger values.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of
ipSystemStatsDiscontinuityTime."

::= { ipIfStatsEntry 13 }

ipIfStatsReasmReqds OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of IP fragments received which needed to be reassembled at this interface.

When tracking interface statistics the counter of the

interface to which these fragments were addressed is incremented. This interface might not be the same as the input interface for some of the fragments.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of
ipIfStatsDiscontinuityTime."

::= { ipIfStatsEntry 14 }

ipIfStatsReasmOKs OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of IP datagrams successfully reassembled.

When tracking interface statistics the counter of the interface to which these datagrams were addressed is incremented. This interface might not be the same as the input interface for some of the datagrams.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of
ipIfStatsDiscontinuityTime."

::= { ipIfStatsEntry 15 }

ipIfStatsReasmFails OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc.). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in [RFC 815](#)) can lose track of the number of fragments by combining them as they are received.

When tracking interface statistics the counter of the interface to which these fragments were addressed is

incremented. This interface might not be the same as the input interface for some of the fragments.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of

```
        ipIfStatsDiscontinuityTime."  
 ::= { ipIfStatsEntry 16 }
```

ipIfStatsInDiscards OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of
ipIfStatsDiscontinuityTime."

```
 ::= { ipIfStatsEntry 17 }
```

ipIfStatsInDelivers OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The total number of datagrams successfully delivered to IP user-protocols (including ICMP).

When tracking interface statistics the counter of the interface to which these datagrams were addressed is incremented. This interface might not be the same as the input interface for some of the datagrams.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of
ipIfStatsDiscontinuityTime."

```
 ::= { ipIfStatsEntry 18 }
```

ipIfStatsHCInDelivers OBJECT-TYPE

SYNTAX Counter64

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The total number of datagrams successfully delivered to IP user-protocols (including ICMP). This object counts the same packets as ipIfStatsInDelivers but allows for larger values.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ipSystemStatsDiscontinuityTime."

```
::= { ipIfStatsEntry 19 }
```

ipIfStatsOutRequests OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipIfStatsOutForwDatagrams.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ipIfStatsDiscontinuityTime."

```
::= { ipIfStatsEntry 20 }
```

ipIfStatsHCOutRequests OBJECT-TYPE

SYNTAX Counter64

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. This object counts the same packets as ipIfStatsHCOutRequests but allows for larger values.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ipSystemStatsDiscontinuityTime."

```
::= { ipIfStatsEntry 21 }
```

```
-- This object ID is reserved to allow the IDs for this table's objects  
-- to align with the objects in the ipSystemStatsTable.  
-- ::= { ipIfStatsEntry 22 }
```

ipIfStatsOutForwDatagrams OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of datagrams for which this entity was not their

final IP destination and for which it was successful in finding a path to their final destination. In entities which do not act as IP routers, this counter will include only those datagrams which were Source-Routed via this entity, and the Source-Route processing was successful.

When tracking interface statistics the counter of the outgoing interface is incremented for a successfully forwarded datagram.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of
ipIfStatsDiscontinuityTime."

::= { ipIfStatsEntry 23 }

ipIfStatsHCOutForwDatagrams OBJECT-TYPE

SYNTAX Counter64

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of datagrams for which this entity was not their final IP destination and for which it was successful in finding a path to their final destination. This object counts the same packets as ipIfStatsOutForwDatagrams but allows for larger values.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of
ipSystemStatsDiscontinuityTime."

::= { ipIfStatsEntry 24 }

ipIfStatsOutDiscards OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include

datagrams counted in `ipIfStatsOutForwDatagrams` if any such datagrams met this (discretionary) discard criterion.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other

times as indicated by the value of
ipIfStatsDiscontinuityTime."
::= { ipIfStatsEntry 25 }

ipIfStatsOutFragReqs OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of IP datagrams that would require fragmentation
in order to be transmitted.

When tracking interface statistics the counter of the
outgoing interface is incremented for a successfully
fragmented datagram.

Discontinuities in the value of this counter can occur at
re-initialization of the management system, and at other
times as indicated by the value of
ipIfStatsDiscontinuityTime."

::= { ipIfStatsEntry 26 }

ipIfStatsOutFragOKs OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The number of IP datagrams that have been successfully
fragmented.

When tracking interface statistics the counter of the
outgoing interface is incremented for a successfully
fragmented datagram.

Discontinuities in the value of this counter can occur at
re-initialization of the management system, and at other
times as indicated by the value of
ipIfStatsDiscontinuityTime."

::= { ipIfStatsEntry 27 }

ipIfStatsOutFragFails OBJECT-TYPE

SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION

"The number of IP datagrams that have been discarded because they needed to be fragmented but could not be. This includes IPv4 packets that have the DF bit set and IPv6

packets that are being forwarded and exceed the outgoing link MTU.

When tracking interface statistics the counter of the outgoing interface is incremented for an unsuccessfully fragmented datagram.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of
ipIfStatsDiscontinuityTime."

```
--  
-- Internet Address Prefix table  
--
```

ipAddressPrefixTable OBJECT-TYPE

SYNTAX SEQUENCE OF IpAddressPrefixEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"This table allows the user to determine the source of an IP address or set of IP addresses and allows other tables to share the information via pointer rather than by copying.

For example when the node configures both a unicast and anycast address for a prefix the ipAddressPrefix objects for those addresses will point to a single row in this table.

This table primarily provides support for IPv6 prefixes and several of the objects are less meaningful for IPv4. The table continues to allow IPv4 addresses to allow future flexibility. In order to promote a common configuration this document includes suggestions for default values for IPv4 prefixes. Each of these values may be overridden if an object is meaningful to the node.

All prefixes used by this entity should be included in this table independent of how the entity learned the prefix. (This table isn't limited to prefixes learned from router advertisements.) "

ipAddressSpinLock OBJECT-TYPE

SYNTAX TestAndIncr

MAX-ACCESS read-write

STATUS current

DESCRIPTION

"An advisory lock used to allow cooperating SNMP managers to coordinate their use of the set operation in creating or modifying rows within this table.

In order to use this lock to coordinate the use of set operations managers should first retrieve `ipvAddressTableSpinLock`. They should then determine the appropriate row to create or modify. Finally they should issue the appropriate set command including the retrieved

value of ipAddressSpinLock. If another manager has altered the table in the meantime, then the value of ipAddressSpinLock will have changed and the creation will fail as it will be specifying an incorrect value for ipAddressSpinLock. It is suggested, but not required, that the ipAddressSpinLock be the first var bind for each set of objects representing a 'row' in a PDU. "

::= { ip 33 }

ipAddressTable OBJECT-TYPE

SYNTAX SEQUENCE OF IpAddressEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"This table contains addressing information relevant to the entity's interfaces.

This table does not contain multicast address information. Tables for such information should be contained in multicast specific MIBs such as [RFC3019](#).

While this table is writable the user will note that several objects, such as ipAddressOrigin, are not. The intention in allowing a user to write to this table is to allow them to add or remove any entry that isn't permanent. The user should be allowed to modify objects and entries when that would not cause inconsistencies within the table. Allowing write access to objects such as ipAddressOrigin could allow a user to insert an entry and then label it incorrectly.

Note well: When including IPv6 link-local addresses in this table the entry must use an InetAddressType of 'ipv6z' in order to differentiate between the possible interfaces.

ipNetToPhysicalTable OBJECT-TYPE

SYNTAX SEQUENCE OF IpNetToPhysicalEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"The IP Address Translation table used for mapping from IP addresses to physical addresses.

The Address Translation tables contain the IP address to 'physical' address equivalences. Some interfaces do not use translation tables for determining address equivalences (e.g., DDN-X.25 has an algorithmic method); if all interfaces are of this type, then the Address Translation table is empty, i.e., has zero entries.

While many protocols may be used to populate this table, ARP [10] and Neighbor Discovery [4] are the most likely options."

 static(4),
 local(5) -- local interface
}
MAX-ACCESS read-create
STATUS current
DESCRIPTION
 "The type of mapping.

Setting this object to the value invalid(2) has the effect of invalidating the corresponding entry in the ipNetToPhysicalTable. That is, it effectively dis-associates the interface identified with said entry from the mapping identified with said entry. It is an implementation- specific matter as to whether the agent removes an invalidated entry from the table. Accordingly, management stations must be prepared to receive tabular information from agents that corresponds to entries not currently in use. Proper interpretation of such entries requires examination of the relevant ipNetToPhysicalType object.

The 'dynamic(3)' type indicates that the IP address to physical addresses mapping has been dynamically resolved using e.g. IPv4 ARP or the IPv6 Neighbor Discovery protocol.

The 'static(4)' type indicates that the mapping has been statically configured. Both of these refer to entries that provide mappings for other entities addresses.

The 'local(5)' type indicates that the mapping is provided for an entity's own interface address.

As the entries in this table are typically not persistent when this object is written the entity SHOULD NOT save the

```
        change to non-volatile storage."

ipv6RouterAdvertSpinLock OBJECT-TYPE

SYNTAX TestAndIncr

MAX-ACCESS read-write

STATUS current

DESCRIPTION

"An advisory lock used to allow cooperating SNMP managers to

coordinate their use of the set operation in creating or modifying rows within this table.

In order to use this lock to coordinate the use of set operations managers should first retrieve `ipv6RouterAdvertSpinLock`. They should then determine the appropriate row to create or modify. Finally they should issue the appropriate set command including the retrieved value of `ipv6RouterAdvertSpinLock`. If another manager has altered the table in the meantime, then the value of `ipv6RouterAdvertSpinLock` will have changed and the creation will fail as it will be specifying an incorrect value for `ipv6RouterAdvertSpinLock`. It is suggested, but not required, that the `ipv6RouterAdvertSpinLock` be the first var bind for each set of objects representing a 'row' in a PDU.

to IPv4 user-protocols (including ICMP).

This object has been deprecated as a new IP version neutral table has been added. It is loosely replaced by
ipSystemStatsIndelivers. "

::= { ip 9 }

ipOutRequests OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

"The total number of IPv4 datagrams which local IPv4 user protocols (including ICMP) supplied to IPv4 in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.

This object has been deprecated as a new IP version neutral table has been added. It is loosely replaced by
ipSystemStatsOutRequests. "

::= { ip 10 }

ipOutDiscards OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

"The number of output IPv4 datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.

This object has been deprecated as a new IP version neutral table has been added. It is loosely replaced by
ipSystemStatsOutDiscards. "

::= { ip 11 }

ipOutNoRoutes OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS deprecated

DESCRIPTION

"The number of IPv4 datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note

that this includes any datagrams which a host cannot route because all of its default routers are down.

This object has been deprecated as a new IP version neutral table has been added. It is loosely replaced by
ipSystemStatsOutNoRoutes. "

            }
```

```
MAX-ACCESS  read-create
```

```
STATUS      deprecated
```

```
DESCRIPTION
```

```
    "The type of mapping.
```

Setting this object to the value invalid(2) has the effect of invalidating the corresponding entry in the ipNetToMediaTable. That is, it effectively dis-associates the interface identified with said entry from the mapping identified with said entry. It is an implementation-specific matter as to whether the agent removes an invalidated entry from the table. Accordingly, management stations must be prepared to receive tabular information from agents that corresponds to entries not currently in use. Proper interpretation of such entries requires examination of the relevant ipNetToMediaType object.

As the entries in this table are typically not persistent when this object is written the entity should not save the change to non-volatile storage. Note: a stronger requirement is not used because this object was previously defined."

8. Security Considerations

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations. These are the tables and objects and their sensitivity/vulnerability:

ipForwarding and ipv6IpForwarding - these objects allow a manager to enable or disable the routing functions on the entity. By

disabling the routing functions an attacker would possibly be able to deny service to users. By enabling the routing functions an attacker could open a conduit into an area. This might result in the area providing transit for packets it shouldn't or allow the attacker access to the area bypassing security safeguards.

ipDefaultTTL and ipv6IpDefaultHopLimit - these objects allow a manager to determine the diameter of the valid area for a packet. By decreasing the value of these objects an attacker could cause packets to be discarded before reaching their destinations.

ipv4InterfaceEnableStatus and ipv6InterfaceEnableStatus - these objects allow a manager to enable or disable IPv4 and IPv6 on a specific interface. By enabling a protocol on an interface an attacker might be able to create an unsecured path into a node (or through it if routing is also enabled). By disabling a protocol on an interface an attacker might be able to force packets to be routed through some other interface or deny access to some or all of the network via that protocol.

ipAddressTable - the objects in this table specify the addresses in use on this node. By modifying this information an attacker can cause a node to either ignore messages destined to it or accept (at least at the IP layer) messages it would otherwise ignore. The use of filtering or security associations may reduce the potential damage in the latter case.

ipv6RouterAdvertTable - the objects in this table specify the information that a router should propagate in its routing advertisement messages. By modifying this information an attacker can interfere with the auto-configuration of all hosts on the link. Most modifications to this table will result in a denial of service to some or all hosts on the link. However two objects, ipv6RouterAdvertManagedFlag and ipv6RouterAdvertOtherConfigFlag, indicate if a host should acquire configuration information from some other source. By enabling these an attacker might be able to cause a host to retrieve its configuration information from a compromised source.

ipNetToPhysicalPhysAddress and ipNetToPhysicalType - these objects specify information used to translate a network (IP) address into a media dependent address. By modifying these objects an attacker could disable communication with a node or divert messages from one node to another. However the attacker may be able to carry out a similar attack by simply responding to the ARP or ND requests made by the target node.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP.

These are the tables and objects and their sensitivity/vulnerability:

Essentially all of the objects in this MIB could be considered sensitive as they report on the status of the IP modules within a system. However the ipSystemStatsTable, ipIfStatsTable and ipAddressTable are likely to be of most interest to an attacker. The statistics tables supply information about the quantity and type of traffic this node is processing and, especially for transit providers, may be considered sensitive. The address table provides a convenient list of all address in use by this node. Each address in isolation is unremarkable however the total list would allow an attacker to correlate otherwise unrelated traffic. For example an attacker might be able to correlate the a [RFC 3041](#) [[15](#)] private address with known public addresses thus circumventing the intentions of [RFC 3041](#).

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [[9](#)], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module, is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

14. RFC Editor Notes

-- RFC Editor
-- This section to be removed as well.

This section contains notes to the RFC Editor and should be removed as the document is converted into an RFC.

Most of the revision history section is to be removed. The sections to be removed include all of the specific changes to various iterations of the drafts and is indicated with a removal tag.

In the module identity section of the MIB (beginning of [section 5](#)) the RFC number of this document must be added in the description field and the first revision field (replacing xxxx).

In the reference section of object ipv6ScopeZoneIndexTable the reference needs to be updated to refer to the correct document if the address architecture document precedes this document as an RFC.

In the references section of object ipDefaultRouterPreference the reference needs to be updated to refer to the correct document.

In the references section (7) the references to 3291Bis, 2096Bis and the router selection RFC must be replaced with proper RFCs as those numbers are assigned.

In the references section (7) the reference to 3513BIS should be replaced with a proper RFC if the address architecture document precedes this one as an RFC.
