**Management Information Base
for the Transmission Control Protocol (TCP)
draft-ietf-ipv6-rfc2012-update-02.txt**

Status of this Document

This document is an Internet-Draft and is in full conformance with all provisions of [Section 10 of RFC2026](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at
<http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at
<http://www.ietf.org/shadow.html>.

This document is a product of the IPv6 MIB Revision Design Team. Comments should be addressed to the editor/authors or the mailing list at ipng@sunroof.eng.sun.com.

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects used for implementations of the Transmission Control Protocol (TCP) [[RFC793](#)] in an IP version independent manner.

[1.](#) The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to [section 7 of RFC 3410](#) [[RFC3410](#)].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, [RFC 2578](#) [[RFC2578](#)], STD 58, [RFC 2579](#) [[RFC2579](#)] and STD 58, [RFC 2580](#) [[RFC2580](#)].

[2.](#) Revision History

Changes from [draft-ietf-ipv6-rfc2012-update-01.txt](#):

23rd February 2003

Changes in this version mainly concentrate on reducing this mib to a bare minimum update of [RFC 2012](#), enough to satisfy the needs of IPv6. The actual modifications are listed below.

Scalars tcpHCInSegs and tcpHCOutSegs dropped.

Objects dropped from the tcpConnectionTable include
tcpConnectionInSegs, tcpConnectionOutSegs,
tcpConnectionInOctets, tcpConnectionOutOctets,
tcpConnectionHCInSegs, tcpConnectionHCOutSegs,
tcpConnectionHCInOctets, tcpConnectionHCOutOctets,

tcpConnectionAge and tcpConnectionId.

Objects dropped from tcpListenerTable include tcpListenerTimeOuts, tcpListenerEstablished and tcpListenerAge.

Updated compliance statements to reflect the aforementioned changes.

Changes from [draft-ietf-ipv6-rfc2012-update-00.txt](#):

4th November 2002

Replaced the tcpConnectionStartTime and tcpListenerStartTime objects with tcpConnectionAge and tcpListenerAge respectively.

Added tcpConnectionRemAddressType as an auxiliary object into the tcpConnectionTable.

Added new object, tcpConnectionId, to provide a link into the TCP-ESTATS-MIB.

Included tcpConnectionAge and tcpConnectionProcess into the tcpConnectionGroup.

Included tcpListenerAge and tcpListenerProcess into the tcpListenerGroup.

tcpListenerGroup added to the mandatory list for compliance.

Changes from [draft-ietf-ipngwg-rfc2012-update-01.txt](#):

27 June 2002

Replaced all occurrences of the term packets to segments, to be consistent with the TCP specification.

Added limits to tcpRtoMin, tcpRtoMax and tcpMaxConn.

Added the scalar, tcpListenerTableLastChange.

Updated the description of tcpConnectionLocalAddress - removed reference to 'listen' state.

Updated the description tcpConnection*Octets to explicitly indicate whether the count includes the TCP header octets.

Updated the description of tcpConnectionStartTime and tcpListenerStartTime - added clarifying text.

Renamed tcpConnectionProcessID to tcpConnectionProcess.

Updated the description of tcpListenerTable.

Raghunarayan, Editor

[Page 3]

Updated the description of `tcpListenerLocalAddressType` to include unknown (0) as a valid value.

Updated the description of `tcpListenerLocalAddress` - the value 'h (zero-length octet-string) represents the case wherein an application is will to accept connections for any IP interface associated with the node.

Removed `tcpListenerRemAddressType`.

Removed `tcpListenerHCConnectionsTimedOut` and `tcpListenerHCConnectionsAccepted`. Added them to open issues, to be added iff deemed required after discussions.

Renamed `tcpListenerConnectionsAccepted` to `tcpListenerEstablished` and `tcpListenerConnectionsTimedOut` to `tcpListenerTimeOuts`.

Renamed `tcpListenerProcessID` to `tcpListenerProcess`.

Updated compliance statement for the object `tcpConnectionState` - support for the value 'deleteTCB (12)' deemed optional.

Added [RFC 2790](#) and [RFC 2287](#) to the References section.

Updated Contact-Info and Editor's address.

Added Authors section.

Changes from [draft-ietf-ipngwg-rfc2012-update-00.txt](#):

14 November 2001

Added HC versions of connection counters.

Added Listener table, with counters for accepted and timed out connection attempts.

Added `tcp{Connection,Listener}ProcessID` to index into SYSAPPL-MIB or HOST-RESOURCES-MIB.

Removed `tcpConnectionRemAddrType`, it must be the same as `tcpConnectionLocalAddrType`.

Changes from [draft-ops-rfc2012-update-00.txt](#)

12 Jul 2001

Turned into IPNG WG document

Added `tcpCountersGroup` for per-connection counters

Changes from first draft posted to v6mib mailing list:

[23 Feb 2001](#)

Made threshold for HC packet counters 1Mpps

Added copyright statements and table of contents

[21 Feb 2001](#) -- Juergen's changes

Renamed tcpInetConn* to tcpConnection*

Updated Conformance info

Added missing tcpConnectionState and tcpConnState objects to SEQUENCES

[6 Feb 2001](#)

Removed v6-only objects.

Renamed inetTcp* to tcpInet*

Added SIZE restriction to InetAddress index objects. (36 = 32-byte addresses plus 4-byte scope, but it's just a strawman)

Used InetPortNumber TC from updated INET-ADDRESS-MIB

Updated compliance statements.

Added Keith to authors

Added open issues section.

Changes from [RFC 2012](#)

Deprecated tcpConnTable

Added tcpConnectionTable

[3. Overview](#)

The current TCP-MIB defined in this memo consists of two tables and a group of scalars:

- The tcp group of scalars reports parameters and statistics of a TCP protocol engine.

- The tcpConnectionTable provides access to status information for all TCP connections handled by a TCP protocol engine. In addition the table also reports identification of the operating system level processes which handle the TCP connections.
- The tcpListenerTable provides access to information about all TCP listening endpoints known by a TCP protocol engine. And similar to the case of the connection table, the tcpListenerTable also reports the identification of the operating system level processes which handle this listening TCP endpoint.

3.1 Relationship to Other MIBs

This section discusses the relationship of this TCP-MIB module to other MIB modules.

3.1.1 Relationship to [RFC1213](#)-MIB

TCP related MIB objects were originally defined as part of the [RFC1213](#)-MIB defined in [RFC 1213](#) [[RFC1213](#)]. The TCP related objects of the [RFC1213](#)-MIB were later copied into a separate MIB module and published in [RFC 2012](#) [[RFC2012](#)] in SMIV2 format.

The previous versions of the TCP-MIB both defined the tcpConnTable, which has been deprecated for basically two reasons:

- (1) The tcpConnTable only supports IPv4.

The current approach in the IETF is to write IP version neutral MIBs rather than having different definitions for various version of IP. This reduces the amount of overhead when new objects are introduced since there is only one place to add them. Hence, the approach taken in [RFC 2452](#) of having separate tables is not continued.

- (2) The tcpConnTable mixes listening endpoints with connections.

It turns out that connections tend to have a different behaviour and management access pattern compared to listening endpoints. Splitting the original tcpConnTable into two tables thus allows to add specific status and statistic objects for listening endpoints and connections.

3.1.2 Relationship to IPV6-TCP-MIB

The IPV6-TCP-MIB defined in [RFC 2452](#) has been moved to Historic since the approach of having separate IP version specific tables is not followed anymore. Implementation of [RFC 2452](#) is thus not suggested anymore.

[3.1.3](#) Relationship to HOST-RESOURCES-MIB and SYSAPPL-MIB

The tcpConnectionTable and the tcpListenerTable report the identification of the operating system level process which handles a connection or a listening endpoint. The value is reported as an Unsigned32 which is expected to be the same as the hrSWRunIndex of the HOST-RESOURCES-MIB [[RFC2790](#)] (if the value is smaller than 2147483647) or the sysAppElmtRunIndex of the SYSAPPL-MIB [[RFC2287](#)]. This allows management applications to identify the TCP connections that belong to an operating system level process which has proven to be valuable in operational environments.

            }
```

MAX-ACCESS read-write

STATUS current

DESCRIPTION

"The state of this TCP connection.

The value listen(2) is included only for parallelism to the old tcpConnTable, and should not be used. A connection in LISTEN state should be present in the tcpListenerTable.

The only value which may be set by a management station is deleteTCB(12). Accordingly, it is appropriate for an agent to return a 'badValue' response if a management station attempts to set this object to any other value.

If a management station sets this object to the value deleteTCB(12), then this has the effect of deleting the TCB (as defined in [RFC 793](#)) of the corresponding connection on the managed node, resulting in immediate termination of the connection.

As an implementation-specific option, a RST segment may be sent from the managed node to the other TCP endpoint (note however that RST segments are not sent reliably)."

```
        hrSWRunIndex or SYSAPPL-MIB::sysAppElmtRunIndex for some  
        row in the appropriate tables."  
 ::= { tcpConnectionEntry 8 }
```

-- The TCP Listener table

tcpListenerTable OBJECT-TYPE

SYNTAX SEQUENCE OF TcpListenerEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"A table containing information about TCP listeners. A listening application can be represented in three possible ways:

1. An application that is willing to accept both IPv4 and IPv6 datagrams is represented by tcpListenerLocalAddressType of unknown (0) and tcpListenerLocalAddress of ''h (a zero-length octet-string).
2. An application which is willing to accept only IPv4 or IPv6 datagrams is represented by a tcpListenerLocalAddressType of the appropriate address type and tcpListenerLocalAddress of ''h (a zero-length octet-string).
3. An application which is listening for data destined only to a specific IP address, but from any remote system, is represented by a tcpListenerLocalAddressType of an appropriate address type, with tcpListenerLocalAddress the specific local address.

NOTE: that address type in this table represents the address type used for the communication, irrespective of the higher-layer abstraction. For example, an application using IPv6 'sockets' to communicate via IPv4 between ::ffff:10.0.0.1 and ::ffff:10.0.0.2 would use InetAddressType ipv4(1))."

8. Security Considerations

There are management objects defined in this MIB that have a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations. These are the tables and objects and their sensitivity/vulnerability:

- o The tcpConnectionState and tcpConnState objects have a MAX-ACCESS clause of read-write, which allows termination of an arbitrary connection. Unauthorized access could cause a denial of service.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

- o The tcpConnectionTable and the tcpConnTable contain objects providing information on the active connections on the device, the status of these connections and the associated processes. This information may be used by an attacker to launch attacks against known/unknown weakness in certain protocols/applications.
- o The tcpListenerTable and the tcpConnTable contain objects providing information on listeners on an entity. For e.g. the tcpListenerLocalPort and tcpConnLocalPort objects can be used to identify what ports are open on the machine and can thus what attacks are likely to succeed, without the attacker having to run a port scanner.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as

provided by the SNMPv3 framework (see [\[RFC3410\], section 8](#)), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

10. Authors

This document is an output of the IPv6 MIB revision team, and contributors to earlier versions of this document include:

Bill Fenner, AT&T Labs -- Research
Email: fenner@research.att.com

Brian Haberman
Email: bkhabs@nc.rr.com

Shawn A. Routhier, Wind River
Email: sar@epilogue.com

Juergen Schoenwalder, TU Braunschweig
Email: schoenw@ibr.cs.tu-bs.de

Dave Thaler, Microsoft
Email: dthaler@windows.microsoft

This documents updates parts of the MIBs from several documents. RFC **2012** has been the base document for these updations. RFC **2452** was the first document to define the managed objects for implementations of TCP over IPv6.

RFC 2012:

Keith McCloghrie, Cisco Systems (Editor)
kzm@cisco.com

[RFC 2452](#):

Mike Daniele, Compaq Computer Corporation
