Symmetric Key Package Content Type
draft-ietf-keyprov-symmetrickeyformat-08.txt

Abstract

This document defines the symmetric key format content type. It is transport independent. The Cryptographic Message Syntax can be used to digitally sign, digest, authenticate, or encrypt this content type.

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html

This Internet-Draft will expire on October 26, 2010.

1. Introduction

This document defines the symmetric key format content type. It is transport independent. The Cryptographic Message Syntax (CMS) [RFC5652] can be used to digitally sign, digest, authenticate, or encrypt this content type.

The use cases that motivated the attributes in this work are elaborated in [PSKC]. They are omitted to avoid duplication.

This document also includes Abstract Syntax Notation One (ASN.1) definitions of the Extensible Markup Language (XML) element and attributes defined in [PSKC].

1.1. Requirements Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

1.2. ASN.1 Syntax Notation

The key package is defined using the ASN.1 [X.680], [X.681], [X.682], and [X.683].

2. Symmetric Key Package Content Type

The symmetric key package content type is used to transfer one or more plaintext symmetric keys from one party to another. A symmetric key package MAY be encapsulated in one or more CMS protecting content types. This content type MUST be Distinguished Encoding Rules (DER) encoded [X.690].

The symmetric key package content type has the following syntax:
SymmetricKeyPackage ::= SEQUENCE {
  version KeyPkgVersion DEFAULT v1,
  sKeyPkgAttrs [0] SEQUENCE SIZE (1..MAX) OF Attribute
    {{ SKeyPkgAttributes }} OPTIONAL,
  sKeys     SymmetricKeys,
  ...   }

SymmetricKeys ::= SEQUENCE SIZE (1..MAX) OF OneSymmetricKey

OneSymmetricKey ::= SEQUENCE {
  sKeyAttrs SEQUENCE SIZE (1..MAX) OF Attribute
    {{ SKeyAttributes }} OPTIONAL,
  sKey     OCTET STRING OPTIONAL
    ( WITH COMPONENTS { ..., sKeyAttrs PRESENT } | 
      WITH COMPONENTS { ..., sKey PRESENT } )

KeyPkgVersion ::= INTEGER  { v1(1) } ( v1, ... )

The SymmetricKeyPackage fields are used as follows:

- version identifies version of the symmetric key package content structure. For this version of the specification, the default value, v1, MUST be used.

- sKeyPkgAttrs optionally provides attributes that apply to all of the symmetric keys in the package. The SKeyPkgAttributes information object set restricts the attributes allowed in sKeyPkgAttrs. If an attribute appears here, then it MUST NOT also be included in sKeyAttrs.

- sKeys contains a sequence of OneSymmetricKey values. This structure is discussed below.
The OneSymmetricKey fields are used as follows:

- sKeyAttrs optionally provides attributes that apply to one symmetric key. The SKeyAttributes information object set restricts the attributes permitted in sKeyAttrs. If an attribute appears here, then it MUST NOT also be included in sKeyPkgAttrs.

- sKey optionally contains the key value encoded as an OCTET STRING.

The OneSymmetricKey field MUST include either sKeyAttrs, or sKey, or sKeyAttrs and sKey.

3. PSKC Attributes

The following attributes are defined to assist those using the symmetric key package defined in this document as part of a Dynamic Symmetric Key Provision Protocol (DSKPP) [DSKPP] with Portable Symmetric Key Container (PSKC) attributes. [PSKC] should be consulted for the definitive attribute descriptions. The attributes fall in to three categories. The first category includes attributes that apply to a key package, and these attributes will generally appear in sKeyPkgAttrs. The second category includes attributes that apply to a particular key, and these attributes will generally appear in sKeyAttrs. The third category includes attributes that apply to a key policy. Of the attributes defined, only the Key Identifier (Section 3.2.1) and Algorithm (Section 3.2.2) key attributes MUST be included. All other attributes are OPTIONAL.

Like PSKC, the Symmetric Key Content Type supports extensibility. Primarily this is accomplished through the definition and inclusion of new attributes, but in some instances where the attribute contains more than one type the ASN.1 "..." extensibility mechanism is employed.

A straightforward approach to conversion from XML types to ASN.1 is employed. The <xs:string> type converts to UTF8String; the XML <xs:dateTime> type converts to GeneralizedTime; and the XML integer types convert to INTEGER or BinaryTime [RFC4049].

3.1. PSKC Key Package Attributes
PSKC key package attributes apply to an entire key package. These attributes can be categorized by two different attribute collections: device information and cryptographic module attributes. All of these key package attributes are OPTIONAL.

3.1.1. Device Information Attributes

Device Information attributes when taken together uniquely identify a device to which the Symmetric Key Package is provisioned.

3.1.1.1. Manufacturer

The Manufacturer attribute indicates the manufacturer of the device. The attribute definition is as follows:

at-pskc-manufacturer ATTRIBUTE ::= {
  TYPE UTF8String IDENTIFIED BY id-pskc-manufacturer }

id-pskc-manufacturer OBJECT IDENTIFIER ::= { id-pskc 1 }

3.1.1.2. Serial Number

The Serial Number attribute indicates the serial number of the device. The attribute definition is as follows:

at-pskc-serialNo ATTRIBUTE ::= {
  TYPE UTF8String IDENTIFIED BY id-pskc-serialNo }

id-pskc-serialNo OBJECT IDENTIFIER ::= { id-pskc 2 }

3.1.1.3. Model

The Model attribute indicates the model of the device. The attribute definition is as follows:

at-pskc-model ATTRIBUTE ::= {
  TYPE UTF8String IDENTIFIED BY id-pskc-model }

id-pskc-model OBJECT IDENTIFIER ::= { id-pskc 3 }

3.1.1.4. Issue Number
The Issue Number attribute contains an issue number to distinguish between two devices with the same serial number. The attribute definition is as follows:

```
at-pskc-issueNo ATTRIBUTE ::= {
    TYPE UTF8String IDENTIFIED BY id-pskc-issueNo }
```

```
id-pskc-issueNo OBJECT IDENTIFIER ::= { id-pskc 4 }
```

### 3.1.1.5. Device Binding

The Device Binding attribute provides an opaque identifier that allows keys to be bound to the device or to a class of devices. When loading keys into a device, the attribute's value MUST be checked against information provided to the user via out-of-band mechanisms. The implementation then ensures that the correct device or class of device is being used with respect to the provisioned key.

```
at-pskc-deviceBinding ATTRIBUTE ::= {
    TYPE UTF8String IDENTIFIED BY id-pskc-deviceBinding }
```

```
id-pskc-deviceBinding OBJECT IDENTIFIER ::= { id-pskc 5 }
```

### 3.1.1.6. Device Start Date

When included in sKeyPkgAttrs, the Device Start Date attribute indicates the start date for a device. The date MUST be expressed in UTC form with no time zone component. Implementations SHOULD NOT rely on time resolution finer than milliseconds and MUST NOT generate time instants that specify leap seconds. The attribute definition is as follows:

```
at-pskc-deviceStartDate ATTRIBUTE ::= {
    TYPE GeneralizedTime IDENTIFIED BY id-pskc-deviceStartDate }
```

```
id-pskc-deviceStartDate OBJECT IDENTIFIER ::= { id-pskc 6 }
```

### 3.1.1.7. Device Expiry Date

When included in sKeyPkgAttrs, the Device Expiry Date attribute indicates the expiry date for a device. The date MUST be expressed
in UTC form with no time zone component. Implementations SHOULD NOT rely on time resolution finer than milliseconds and MUST NOT generate time instants that specify leap seconds. The attribute definition is as follows:

\[
\text{at-pskc-deviceExpiryDate ATTRIBUTE ::= }
\begin{array}{l}
\text{TYPE GeneralizedTime IDENTIFIED BY id-pskc-deviceExpiryDate }
\end{array}
\]

\[
\text{id-pskc-deviceExpiryDate OBJECT IDENTIFIER ::= }
\begin{array}{l}
\text{\{ id-pskc 7 \}}
\end{array}
\]

### 3.1.2. Cryptographic Module Information Attributes

Cryptographic Module attributes uniquely identify a cryptographic module. This is useful when the device contains more than one cryptographic module. At this time only one attribute is defined.

#### 3.1.2.1. Cryptographic Module Identifier

When included in sKeyPkgAttrs, the Cryptographic Module Identifier attribute uniquely identifies the cryptographic module to which the key is being or was provisioned. The attribute definition is as follows:

\[
\text{at-pskc-moduleId ATTRIBUTE ::= }
\begin{array}{l}
\text{TYPE UTF8String IDENTIFIED BY id-pskc-moduleId }
\end{array}
\]

\[
\text{id-pskc-moduleId OBJECT IDENTIFIER ::= }
\begin{array}{l}
\text{\{ id-pskc 8 \}}
\end{array}
\]

Symmetric Key Package Content Type

April 2010

### 3.2. PSKC Key Attributes

PSKC key attributes apply to a specific key. As noted earlier, the Key Identifier (Sec 3.2.1) and Algorithm (Sec 3.2.2) key attributes are REQUIRED. All other attributes are OPTIONAL.

#### 3.2.1. Key Identifier

When included in sKeyAttrs, the Key Identifier attribute uniquely identifies the key. The attribute definition is as follows:

\[
\text{at-pskc-keyId ATTRIBUTE ::= }
\begin{array}{l}
\text{TYPE UTF8String IDENTIFIED BY id-pskc-keyId }
\end{array}
\]
3.2.2. Algorithm

The Algorithm attribute uniquely identifies the PSKC algorithm profile. [PSKC] defines two algorithm profiles "HOTP" and "KEYPROV-PIN". The attribute definition is as follows:

at-pskc-algorithm ATTRIBUTE ::= {
  TYPE UTF8String IDENTIFIED BY id-pskc-algorithm }

id-pskc-algorithm OBJECT IDENTIFIER ::= { id-pskc 10 }

3.2.3. Issuer

The Issuer attribute names the entity that issued the key. The attribute definition is as follows:

at-pskc-issuer ATTRIBUTE ::= {
  TYPE UTF8String IDENTIFIED BY id-pskc-issuer }

id-pskc-issuer OBJECT IDENTIFIER ::= { id-pskc 11 }

3.2.4. Key Profile Identifier

The Key Profile Identifier attribute carries a unique identifier used between the sending and receiving parties to establish a set of key attribute values that are not transmitted within the container but agreed between the two parties out of band. This attribute will then represent the unique reference to a set of key attribute values.

at-pskc-keyProfileId ATTRIBUTE ::= {
  TYPE UTF8String IDENTIFIED BY id-pskc-keyProfileId }

3.2.5. Key Reference Identifier

The Key Reference attribute refers to an external key to be used with a key derivation scheme and no specific key value (secret) is transported but only the reference to the external master key is used (e.g., the PKCS#11 key label).
3.2.6. Friendly Name

The Friendly Name attribute contains a human readable name for the secret key. The attribute definition is as follows:

```
at-pskc-friendlyName ATTRIBUTE ::= {
    TYPE UTF8String IDENTIFIED BY id-pskc-friendlyName }
```

```
id-pskc-friendlyName OBJECT IDENTIFIER ::= { id-pskc 14 }
```

The text is encoded in UTF-8 [RFC3629], which accommodates most of the world's writing systems. The friendlyNameLangTag field identifies the language used to express the friendlyName. When friendlyNameLangTag is absent, English is used. The value of the friendlyNameLangTag should be a language tag as described in [RFC5646].

3.2.7. Algorithm Parameters

The Algorithm Parameters attribute contains parameters that influence the result of the algorithmic computation, for example response truncation and format in One-Time Password (OTP) and Challenge-Response (CR) algorithms.

```
at-pskc-algorithmParameters ATTRIBUTE ::= {
    TYPE PSKCAlgorithmParameters
    IDENTIFIED BY id-pskc-algorithmParams }
```

```
id-pskc-algorithmParams OBJECT IDENTIFIER ::= { id-pskc 15 }
```

```
PSKCAlgorithmParameters ::= CHOICE {
```

The Algorithm Parameters attribute has the following syntax:
challengeFormat  [0] ChallengeFormat,
responseFormat   [1] ResponseFormat,
... }

ChallengeFormat ::= SEQUENCE {
  encoding   Encoding,
  checkDigit BOOLEAN DEFAULT FALSE,
  min         INTEGER (0..MAX),
  max         INTEGER (0..MAX),
  ... }

Encoding ::= UTF8STRING ("DECIMAL" | "HEXADECIMAL" |
  "ALPHANUMERIC" |"BASE64" |"BINARY")

ResponseFormat ::= SEQUENCE {
  encoding   Encoding,
  length     INTEGER (0..MAX),
  checkDigit BOOLEAN DEFAULT FALSE,
  ... }

The fields in PSKCAIgorithmParameters have the following meanings:

- ChallengeFormat defines the characteristics of the challenge in a
  CR usage scenario whereby the following fields are defined:

  - encoding specifies the encoding of the challenge accepted by
    the device and MUST be one of the following values: DECIMAL,
    HEXADECIMAL, ALPHANUMERIC, BASE64, or BINARY. The BASE64
    encoding is done as in Section 4 of [RFC4648].

  - checkDigit indicates whether a device needs to check the
    appended Luhn check digit, as defined in [LUHN], contained in a
    challenge. The checkDigit MUST NOT be present if the encoding
    value is anything other than 'DECIMAL'. A value of TRUE
    indicates that the device will check the appended Luhn check
    digit in a provided challenge. A value of FALSE indicates that
    the device will not check the appended Luhn check digit in the
    challenge.

  - min defines the minimum size of the challenge accepted by the
    device for CR mode. If encoding is 'DECIMAL', 'HEXADECIMAL' or
    'ALPHANUMERIC' this value indicates the minimum number of
digits/characters. If encoding is 'BASE64' or 'BINARY', this
value indicates the minimum number of bytes of the unencoded value.

- `max` defines the maximum size of the challenge accepted by the device for CR mode. If encoding is 'DECIMAL', 'HEXADECIMAL' or 'ALPHANUMERIC' this value indicates the maximum number of digits/characters. If the encoding is 'BASE64' or 'BINARY', this value indicates the maximum number of bytes of the unencoded value.

- `ResponseFormat` defines the characteristics of the result of a computation and defines the format of the OTP or the response to a challenge. For cases where the key is a personal identification number (PIN) value, this element contains the format of the PIN itself (e.g., DECIMAL, length 4 for a 4 digit PIN). The following fields are defined:
  - `encoding` specifies the encoding of the response generated by the device and MUST be one of the following values: DECIMAL, HEXADECIMAL, ALPHANUMERIC, BASE64, or BINARY. BASE64 is defined as in Section 4 of [RFC4648].
  - `length` defines the length of the response generated by the device. If encoding is 'DECIMAL', 'HEXADECIMAL' or 'ALPHANUMERIC' this value indicates the number of digits/characters. If encoding is 'BASE64' or 'BINARY', this value indicates the number of bytes of the unencoded value.
  - `checkDigit` indicates whether the device needs to append a Luhn check digit, as defined in [Luhn], to the response. This is only valid if encoding attribute is 'DECIMAL'. If the value is TRUE then the device will append a Luhn check digit to the response. If the value is FALSE, then the device will not append a Luhn check digit to the response.

3.2.8. Counter

The Counter attribute contains the event counter for event-based OTP algorithms. The attribute definition is as follows:

```
at-pskc-counter ATTRIBUTE ::= {
    TYPE INTEGER(0..MAX) IDENTIFIED BY id-pskc-counter }

id-pskc-counter OBJECT IDENTIFIER ::= { id-pskc 16 }
```
3.2.9. Time

The Time attribute conveys the time for time-based OTP algorithms. If the Time Interval attribute is included, then this element carries the number of time intervals passed for a specific start point. It uses the BinaryTime syntax from [RFC4049]. The attribute definition is as follows:

```plaintext
at-pskc-time ATTRIBUTE ::= {
    TYPE BinaryTime IDENTIFIED BY id-pskc-time }

id-pskc-time OBJECT IDENTIFIER ::= { id-pskc 17 }
```

3.2.10. Time Interval

The Time Interval attribute conveys the time interval value for time-based OTP algorithms. It is an integer. The attribute definition is as follows:

```plaintext
at-pskc-timeInterval ATTRIBUTE ::= {
    TYPE INTEGER (0..MAX) IDENTIFIED BY id-pskc-timeInterval }

id-pskc-timeInterval OBJECT IDENTIFIER ::= { id-pskc 18 }
```

3.2.11. Time Drift

The Time Drift attribute contains the device clock drift value, the number of seconds per day the device clocks drifts, for time-based OTP algorithms. It is an integer. The attribute definition is as follows:

```plaintext
at-pskc-timeDrift ATTRIBUTE ::= {
    TYPE INTEGER (0..MAX) IDENTIFIED BY id-pskc-timeDrift }

id-pskc-timeDrift OBJECT IDENTIFIER ::= { id-pskc 19 }
```

3.2.12. Value MAC

The Value MAC attribute is a Message Authentication Code (MAC) generated from the encrypted value in case the encryption algorithm does not support integrity checks (e.g., AES-CBC does not provide integrity while AES Key Wrap with MLI does). The attribute definition is as follows:
at-pskc-valueMAC ATTRIBUTE ::= {
  TYPE ValueMac IDENTIFIED BY id-pskc-valueMAC }

ValueMac ::= SEQUENCE {
  macAlgorithm UTF8String,
  mac          UTF8String }

The fields in ValueMac have the following meanings:

  o macAlgorithm identifies the MAC algorithm used to generate the
    value placed in digest.

  o mac is the base64 encoded, as specified in Section 4 of [RFC4648],
    mac value.

3.3. Key Policy Attributes

Key policy attributes indicate a policy that can be attached to a
key. These attributes are defined in the subsections that follow.

3.3.1. Key Start Date

When included in sKeyAttrs, the Key Start Date attribute indicates
the start of the keys validity. The date MUST be expressed in UTC
form with no time zone component. Implementations SHOULD NOT rely on
time resolution finer than milliseconds and MUST NOT generate time
instants that specify leap seconds. The attribute definition is as
follows:

at-pskc-keyStartDate ATTRIBUTE ::= {
  TYPE GeneralizedTime IDENTIFIED BY id-pskc-keyStartDate }

id-pskc-keyStartDate OBJECT IDENTIFIER ::= { id-pskc 21 }

3.3.2. Key Expiry Date

When included in sKeyAttrs, the Key Expiry Date attribute indicates
the end of the key's validity period. The date MUST be expressed in
UTC form with no time zone component. Implementations SHOULD NOT rely on time resolution finer than milliseconds and MUST NOT generate time instants that specify leap seconds. The attribute definition is as follows:

```
at-pskc-keyExpiryDate ATTRIBUTE ::= {
    TYPE GeneralizedTime IDENTIFIED BY id-pskc-keyExpiryDate }
```

```
id-pskc-keyExpiryDate OBJECT IDENTIFIER ::= { id-pskc 22 }
```

### 3.3.3. Number of Transactions

The Number of Transactions attribute indicates the maximum number of times a key carried within the package can be used. When this element is omitted there is no restriction regarding the number of times a key can be used. The attribute definition is as follows:

```
at-pskc-noOfTransactions ATTRIBUTE ::= {
    TYPE INTEGER (0..MAX) IDENTIFIED BY id-pskc-noOfTransactions }
```

```
id-pskc-noOfTransactions OBJECT IDENTIFIER ::= { id-pskc 23 }
```

### 3.3.4. Key Usage

The Key Usage attribute constrains the intended usage of the key. The recipient MUST enforce the key usage. The attribute definition is as follows:

```
at-pskc-keyUsage ATTRIBUTE ::= {
    TYPE PSKCKeyUsages IDENTIFIED BY id-pskc-keyUsages }
```

```
id-pskc-keyUsages OBJECT IDENTIFIER ::= { id-pskc 24 }
```

```
PSKCKeysUsages ::= SEQUENCE OF PSKCKeyUsage
```

```
PSKCKeysUsage ::= UTF8String ("OTP" | "CR" | "Encrypt" |
    "Integrity" | "Verify" | "Unlock" | "Decrypt" |
    "KeyWrap" | "Unwrap" | "Derive" | "Generate")
```

The fields in PSKCKeysUsage have the following meanings:

- **OTP**: The key MUST only be used for OTP generation.
o CR: The key MUST only be used for Challenge/Response purposes.

o Encrypt: The key MUST only be used for data encryption purposes.

o Integrity: The key MUST only be used to generate a keyed message digest for data integrity or authentication purposes.

o Verify: The key MUST only be used to verify a keyed message digest for data integrity or authentication purposes (is converse of Integrity).

o Unlock: The key MUST only be used for an inverse challenge response in the case where a user has locked the device by entering a wrong PIN too many times (for devices with PIN-input capability).

o Decrypt: The key MUST only be used for data decryption purposes.

o KeyWrap: The key MUST only be used for key wrap purposes.

o Unwrap: The key MUST only be used for key unwrap purposes.

o Derive: The key MUST only be used with a key derivation function to derive a new key (see also Section 8.2.4 of [NIST800-57]).

o Generate: The key MUST only be used to generate a new key based on a random number and the previous value of the key (see also Section 8.1.5.2.1 of [NIST800-57]).

3.3.5. PIN Policy

The PIN Policy attribute allows policy about the PIN usage to be associated with the key. The attribute definition is as follows:

\texttt{at-pskc-pinPolicy ATTRIBUTE ::= \{ \\
\text{ TYPE PINPolicy IDENTIFIED BY id-pskc-pinPolicy \} \\
\}}

\texttt{id-pskc-pinPolicy OBJECT IDENTIFIER ::= \{ id-pskc 25 \}}

\texttt{PINPolicy ::= SEQUENCE \{ \\
pinKeyId [0] UTF8String OPTIONAL, \\
\}}
The fields in PIN Policy have the following meanings:

- **pinKeyId** uniquely identifies the key held within this container that contains the value of the PIN that protects the key.
- **pinUsageMode** indicates the way the PIN is used during the usage of the key. The following values are defined in [PSKC]: Local, Prepend, Append, Algorithmic.
- **maxFailedAttempts** indicates the maximum number of times the PIN may be entered wrongly before it MUST NOT be possible to use the key anymore.
- **minLength** indicates the minimum length of a PIN that can be set to protect the associated key. It MUST NOT be possible to set a PIN shorter than this value. If pinEncoding is 'DECIMAL', 'HEXADECIMAL' or 'ALPHANUMERIC' this value indicates the number of digits/characters. If pinEncoding is 'BASE64' or 'BINARY', this value indicates the number of bytes of the unencoded value.
- **maxLength** indicates the maximum length of a PIN that can be set to protect this key. It MUST NOT be possible to set a PIN longer than this value. If pinEncoding is 'DECIMAL', 'HEXADECIMAL' or 'ALPHANUMERIC' this value indicates the number of digits/characters. If the pinEncoding is 'BASE64' or 'BINARY', this value indicates the number of bytes of the unencoded value.
- **pinEncoding** is based on Encoding, which is defined in Section 3.2.6, and specifies encoding of the PIN and MUST be one of the following values: DECIMAL, HEXADECIMAL, ALPHANUMERIC, BASE64, or BINARY.
If pinUsageMode is set to "Local" then the device MUST enforce the restriction indicated in maxFailedAttempts, minLength, maxLength and pinEncoding, otherwise it MUST be enforced on the server side.

4. Key Encoding

Two parties receiving the same key as an sKey OCTET STRING must make use of the key in exactly the same way in order to interoperate. To ensure that, it is necessary to define a correspondence between the abstract syntax of sKey and the notation in the standard algorithm description that defines how the key is used. The next sections establish that correspondence for the algorithms AES [FIPS197] and TDEA [SP800-67].

4.1. AES Key Encoding

[FIPS197] section 5.2, titled Key Expansion, uses the input key as an array of bytes indexed starting at 0. The first octet of sKey SHALL become the key byte in AES labeled index 0 in [FIPS197]; it SHALL be the first octet of sKey, and the other key bytes SHALL follow in index order.

Proper parsing and key load of the contents of sKey for AES SHALL be determined by using the following sKey octet string to generate and match the key expansion test vectors in [FIPS197] Appendix A for AES Cipher Key: 2b 7e 15 16 28 ae d2 a6 ab f7 15 88 09 cf 4f 3c

Tag Length Value
04  16     2b 7e 15 16 28 ae d2 a6 ab f7 15 88 09 cf 4f 3c

4.2. Triple DES Key Encoding

A Triple-DES key consists of three keys for the cryptographic engine (Key1, Key2, and Key3) that are each 64 bits (even though only 56 are used); the three keys are also referred to as a key bundle (KEY) [SP800-67]. A key bundle may employ either two or three mutually independent keys. When only two are employed (called two-key Triple DES), then Key1 = Key3.

Each key in a Triple-DES key bundle is expanded into a key schedule according to a procedure defined in [SP800-67] Appendix A. That procedure numbers the bits in the key from 1 to 64, with number 1
being the left-most, or most significant bit (MSB). The first octet of sKey SHALL be bits 1 through 8 of Key1 with bit 1 being the MSB. The second octet of sKey SHALL be bits 9 through 16 of Key1, and so forth, so that the trailing octet of sKey SHALL be bits 57 through 64 of Key3 (or Key2 for two-key Triple DES).

Proper parsing and key load of the contents of sKey for Triple-DES SHALL be determined by using the following sKey octet string to generate and match the key expansion test vectors in [SP800-67] appendix B for the key bundle:

Key1 = 0123456789ABCDEF
Key2 = 23456789ABCDEF01
Key3 = 456789ABCDEF0123

<table>
<thead>
<tr>
<th>Tag</th>
<th>Length</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>24</td>
<td>0123456789ABCDEF 23456789ABCDEF01 456789ABCDEF0123</td>
</tr>
</tbody>
</table>

5. Security Considerations

Implementers of this protocol are strongly encouraged to consider generally accepted principles of secure key management when integrating this capability within an overall security architecture.

The symmetric key package contents are not protected. This content type can be combined with a security protocol to protect the contents of the package. One possibility is to include this content type in place of a PSKC package in [DSKPP] exchanges. In this case, the algorithm requirements are found in those documents. Another possibility is to encapsulate this content type in a CMS [RFC5652] protecting content type.

6. IANA Considerations

This document makes use of object identifiers to identify a CMS content type (Appendix A.1), the ASN.1 version of the PSKC attributes (Appendix A.2), and the ASN.1 modules found in Appendix A.1 and A.2. All OIDs are registered in an arc delegated by IANA to the SMIME Working Group. No further action by IANA is necessary for this document or any anticipated updates.

APPENDIX A: ASN.1 Module

This appendix provides the normative ASN.1 definitions for the structures described in this specification using ASN.1 as defined in [X.680] through [X.683].

A.1. Symmetric Key Package ASN.1 Module
