General Purpose Extended Key Usage (EKU) for Document Signing X.509 Certificates

Abstract

   RFC 5280 specifies several extended key usages for X.509
   certificates. This document defines a general purpose document
   signing extended key usage for X.509 public key certificates which
   restricts the usage of the certificates for document signing.

About This Document

   This note is to be removed before publishing as an RFC.

   Status information for this document may be found at https://
   datatracker.ietf.org/doc/draft-ietf-lamps-documentsigning-eku/.

   Discussion of this document takes place on the Limited Additional
   Mechanisms for PKIX and SMIME (LAMPS) Working Group mailing list
   (mailto:spasm@ietf.org), which is archived at https://
   mailarchive.ietf.org/arch/browse/spasm/.

   Source for this draft and an issue tracker can be found at https://
   github.com/lamps-wg/documentsigning-eku.

Status of This Memo

   This Internet-Draft is submitted in full conformance with the
   provisions of BCP 78 and BCP 79.

   Internet-Drafts are working documents of the Internet Engineering
   Task Force (IETF). Note that other groups may also distribute
   working documents as Internet-Drafts. The list of current Internet-
   Drafts is at https://datatracker.ietf.org/drafts/current/.

   Internet-Drafts are draft documents valid for a maximum of six
   months and may be updated, replaced, or obsoleted by other documents
   at any time. It is inappropriate to use Internet-Drafts as reference
   material or to cite them other than as "work in progress."

   This Internet-Draft will expire on 3 September 2022.

Table of Contents

1. Introduction

   [RFC5280] specifies several extended key usages for X.509
   certificates. In addition, several extended key usage had been added
   [RFC7299] as public Object Identifier (OID) under the IANA
   repository. While usage of any extended key usage is bad practice
   for publicly trusted certificates, there are no public and general
   extended key usage explicitly assigned for Document Signing
   certificates. The current practice is to use id-kp-emailProtection,
   id-kp-codeSigning or vendor defined OID for general document signing
   purposes.

   In circumstances where code signing and S/MIME certificates are also
   widely used for document signing, the technical or policy changes
   that are made to code signing and S/MIME certificates may cause
   unexpected behaviors or have an adverse impact such as decreased

cryptographic agility on the document signing ecosystem and vice versa.

There is no issue if the vendor defined OIDs are used in a PKI (or a trust program) governed by the vendor. However, if the OID is used outside of the vendor governance, the usage can easily become out of control (e.g. - When the end user encounters vendor defined OIDs, they might want to ask that vendor about use of the certificate, however, the vendor may not know about the particular use. - If the issuance of the cert is not under the control of the OID owner, there is no way for the OID owner to know what the impact will be if any change is made to the OID in question, and it would restrict vendor's choice of OID management. etc.).

Therefore, it is not favorable to use a vendor defined EKU for signing a document that is not governed by the vendor.

This document defines a general Document Signing extended key purpose identifier.

2. Conventions and Definitions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. Extended Key usage for DocumentSigning

This specification defines the KeyPurposeId id-kp-documentSigning. Inclusion of this KeyPurposeId in a certificate indicates that the use of any Subject names in the certificate is restricted to use by a document signing.

Term of "Document Sign" in this document is digitally sign contents that are consumed by humans. To be more precise, contents are intended to be shown to human with printable or displayable form by means of services or software, rather than processed by machines.

3.1. Extended Key Usage Values for Document Signing

[RFC5280] specifies the EKU X.509 certificate extension for use in the Internet. The extension indicates one or more purposes for which the certified public key is valid. The EKU extension can be used in conjunction with the key usage extension, which indicates how the public key in the certificate is used, in a more basic cryptographic way.

The EKU extension syntax is repeated here for convenience:

```
ExtKeyUsageSyntax  ::=  SEQUENCE SIZE (1..MAX) OF KeyPurposeId

KeyPurposeId  ::=  OBJECT IDENTIFIER
```

This specification defines the KeyPurposeId id-kp-documentSigning.
Inclusion of this KeyPurposeId in a certificate indicates that the
use of any Subject names in the certificate is restricted to use by
a document signing service or a software (along with any usages
allowed by other EKU values).

```
id-kp  OBJECT IDENTIFIER  ::=
    { iso(1) identified-organization(3) dod(6) internet(1)
      security(5) mechanisms(5) pkix(7) 3 }

id-kp-documentSigning  OBJECT IDENTIFIER  ::=  { id-kp XX }
```

4. Using the Document Signing EKU in a Certificate

[RFC8358] specifies the conventions for digital signatures on
Internet-Drafts. This is one of the intended use cases for the
general document signing EKU described in this document. [RFC8358]
uses CMS to digitally sign a wide array of files such as ASCII, PDF,
EPUB, HTML etc. Currently, there are no specification regarding EKU
for certificates signing those files except those which are defined
by the software vendor.

The signed contents of Internet-Drafts are primarily intended to be
consumed by people. To be more precise, contents are intended to be
shown to a person in a printable or displayable form by means of
services or software, rather than processed by machines. To validate
the digital signature on the contents that is intended to be
consumed by people, implementations MAY perform the steps below as a
certificate validation.

The implementation MAY examine the Extended Key Usage value(s):

  1. If there are no restrictions set for the relying party and the
     relying party software, the certificate is acceptable.

  2. If there are restrictions set for the replying party and
     relying party software, proceed as following.

     Each Restriction on the EKUs can be "Excluded EKU" or
     "Permitted EKU" and handled.

     The procedure is intended to permit or prohibit presence of a
     certain EKU or complete absence of EKUs. It is outside the
     scope of this document, but the relying party can permit or
     exclude combinations of EKU. A consideration on prohibiting

combination of EKUs is described in the security consideration
section of this document.

Excluded EKUs procedure: "Excluded EKU" is an EKU which the
relying party or the relying party software prohibits.
Examples of "Excluded EKU" are, presence of
anyExtendedKeyUsage or complete absence of EKU extension on
a certificate. If an EKU of the certificate meets the
conditions set by the "Excluded EKU" restriction, the
relying party or the relying party software rejects the
certificate.

Permitted EKU procedure: "Permitted EKU" is an EKU which the
relying party or the relying party software accepts.
Examples of "Permitted EKU" are, presence of this general
document signing EKU and/or protocol specific document
signing-type EKUs. If an EKU of the certificate meets the
condition set by a "Permitted EKU" restriction, the
certificate is acceptable. Otherwise, relying party or the
relying party software rejects the certificate.

When a single software has capability to process various data
formats, the software may choose to make the excluded and permitted
decisions separately in accordance with the format it is handling
(e.g. text, pdf, etc).

5.   Implications for a Certification Authority

The procedures and practices employed by a certification authority
MUST ensure that the correct values for the EKU extension are
inserted in each certificate that is issued. Unless certificates are
governed by a vendor specific PKI (or trust program), certificates
that indicate usage for document signing MAY include the id-kp-
documentSigning EKU extension. This does not encompass the mandatory
usage of the id-kp-documentSigning EKU in conjunction with the
vendor specific EKU. However, this does not restrict the CA from
including multiple EKUs related to document signing.

6.   Security Considerations

The usage of id-kp-documentSigning EKU intends to prevent id-kp-
emailProtection from being used for purposes other than email and
id-kp-codeSigning used to sign objects other than binary codes. This
EKU does not introduce new security risks but instead reduces
existing security risks by providing means to separate other EKUs
used for communication protocols namely, TLS or S/MIME etc. in order
to minimize the risk of cross protocol attacks.

To reduce the risk of specific cross protocol attacks, the relying party or relying party software may additionaly prohibit use of specific combination of EKUs.

While a specific protocol or signing scheme may choose to come up with their own EKU, some may not have significant motive or resource to set up and manage thier own EKU. This general document signing EKU may be used as a stop gap for those that intend to set up their own EKU or those who do not intend to set up an EKU but still would like to distinguish from other usage.

Introduction of this id-kp-documentSigning EKU value does not introduce any new security or privacy concerns.

7. IANA Considerations

This document requests that IANA make two assignments. One for the id-kp-documentSigning object identifier (OID), as defined in Section 3.1, for the EKU from the "SMI Security for PKIX Extended Key Purpose" (1.3.6.1.5.5.7.3) registry. Another for the id-mod-docsign-eku, as defined in Appendix A, for the ASN.1 module [X.680] from the in the "SMI Security for PKIX Module Identifier" (1.3.6.1.5.5.7.0) registry. No further action is necessary by IANA.

Appendix A. ASN.1 Module

The following ASN.1 module provides the complete definition of the
Document Signing EKU.

```
DocSignEKU { iso(1) identified-organization(3) dod(6) internet(1)
  security(5) mechanisms(5) pkix(7) id-mod(0)
  id-mod-docsign-eku(TBD1) }

DEFINITIONS EXPLICIT TAGS ::=

BEGIN

-- EXPORTS ALL --

-- IMPORTS NOTHING --

-- OID Arc --

id-kp  OBJECT IDENTIFIER  ::= {
  iso(1) identified-organization(3) dod(6) internet(1)
  security(5) mechanisms(5) pkix(7) kp(3) }

-- Document Signing Extended Key Usage --

id-kp-documentSigning OBJECT IDENTIFIER ::= { id-kp TBD2 }

END
```

Acknowledgments

We would like to thank Russ Housley for verifying the ASN.1 module.
