Network-Hexagons: H3-LISP Dataflow Virtualization for Mobility Edge
draft-ietf-lisp-nexagon-20

Abstract

   Geolocation-Services aggregate raw data uploads from vehicles using
   mobility edge compute locations and process these uploads to verified
   ,localized, geospatial detection-channels. Geospatial detection
   channels are used by mobility clients in vehicles and in the cloud to
   support aspects of Mobility use-cases: i. Crowd-sourced mapping of
   lanes, markings, and signage ii. Intelligent Driving heads-up
   notifications on hazards, blockages, and connivances such as parking
   or charging on the driving route.

   The allocation of Geolocation Services is dynamic and adjusted to
   road activity and number of active vehicles. This dynamics combined
   with the dynamics of vehicles mobile-access IP Anchors creates
   coherency, context-switching, geo-privacy, and service continuity key
   issues. These issues are resolved by dataflow virtualization, or
   communication indirection, between mobility clients in vehicles and
   Geolocation Services. LISP overlay network-virtualization offers a
   mobility-network solution. Such a LISP mobility-network deployment is
   described in this informational document.

Status of This Memo

   This Internet-Draft is submitted in full conformance with the
   provisions of BCP 78 and BCP 79.

   Internet-Drafts are working documents of the Internet Engineering
   Task Force (IETF). Note that other groups may also distribute
   working documents as Internet-Drafts. The list of current Internet-
   Drafts is at https://datatracker.ietf.org/drafts/current/.

   Internet-Drafts are draft documents valid for a maximum of six months

and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

1. Introduction

   Geolocation-Services aggregate raw data uploads from vehicles using
   mobility edge compute locations and process these uploads to verified
   ,localized, geospatial detection-channels. Geospatial detection
   channels are used by mobility clients in vehicles and in the cloud to
   support aspects of Mobility use-cases: i. Crowd-sourced mapping of
   lanes, markings, and signage ii. Intelligent Driving heads-up
   notifications on hazards, blockages, and connivances such as parking
   or charging on the driving route.

Geolocation services transform inaccurate, duplicated geospatial data captured and uploaded by multiple vehicles points of view, into consolidated information channels. Functional abstraction of a Geolocation Service includes:

- Addressable queues for uploads from mobility clients in vehicles
- Addressable detection channels subscribed to by mobility clients
- State & functions transforming upload data to detection channels

In order to scale in large cities and dense areas Geolocation Services are broken to shards, or geospatial areas, according to formal grid lines. The allocation of Geolocation Services shards is dynamic and adjusted to road activity and number of active vehicles during times of the day. Less shards per compute location and more locations during peak commute hours to absorb the upload and processing load, more shards per location and less compute locations during the night, and the various street load conditions in between. This dynamics combined with the dynamics of mobility clients in vehicles selecting mobile-provider, and consequently switching IP Anchors, creates key-issues:

- Coherency of Geolocation Services IP addresses cached in clients
- Context-switching between Geolocation Service shards while driving
- Geo-privacy of clients while interacting with Geolocation Services
- Service continuity when clients switch providers while driving

These issues are resolved by dataflow virtualization, or communication indirection, between mobility clients and Geolocation Services. Such communication when based on logical addresses of entities and geospatial topics solves these issues. It allows for dynamic and portable allocation of Geolocation Services, algorithmic context-switching between Geolocation Services while driving, service continuity when mobile carriers are switched by vehicle modules while driving for reception, preserving the geo-privacy of mobility clients. LISP overlay network-virtualization can offer such a solution through specific use of Endpoint Identifiers (EID):
- EID addressing of upload queues per geospatial grid identifiers
- EID addressing of detection channels per geospatial topics
- EID addressing of mobility clients assigned and renewed periodically

These EIDs are tracked by the LISP mobility-network offering dynamic portability of queues and channels, where functions are assumed to be available in any compute location. Geolocation current-state used for consolidation is quickly regenerated by Geolocation Services.

EIDs of mobility clients are tracked across the LISP mobility-network enabling service continuity when mobile carriers are switched by the vehicle systems. These EIDs are ephemeral and make it difficult

for just any mobility service provider to track mobility clients
movement during the day. The use of LISP as the mobility-network for
dataflow virtualization between mobility client to Geolocation
Services is described in this informational document

Note 1: The breakdown of Geolocations Services to area-shards is done based on formal grid lines known to both mobility clients and Geolocation Services. Geospatial detections both raw uploads and consolidated channels are also done using a formal grid known to both clients and services. This document is based on the H3 grid (https://h3geo.org/).H3 resolution 9 (H3.r9) or roughly 0.1 square kilometers is used for the Geolocation Services shards, and H3 resolution 15 (H3.r15), roughly 1 square meter is used for geospatial detections. Each such H3 hexagonal tile anywhere on the earth has a unique 64bit identifier (HID).

Note 2: LISP solution for dataflow virtualization is an application network. In order for clients and services to use it there needs to be a formal provisioning step. For the clients this step will require AAA procedure by which clients are assigned and renew EIDs and XTRs to be used to communicate with services. This process may be done in various vendor specific methods, in this document we use a DIAMETER [RFC6733] based AAA service, this is meant as a life-cycle example only.

Note 3: In order to make the notion of geospatial detection concrete, we add to the 64bit HID of "where" is a detection, 64bit of "what" is the detection. These 64bits are detailed in a bit-mask of possible detections based on a taxonomy defined by Berkeley Deep Drive (BDD) consortium (https://bdd-data.berkeley.edu). It is meant as a baseline that can be extended in additional specifications, yet proven minimal sufficient in current implementations.

2. Definition of Terms

H3ServiceEID: Is an EID addressable Geolocation Service shard.
   It is a designated destination for geospatial detections,
   and an (s,g) source of multicast of themed detection channels.
   It has a light-weight LISP protocol stack to tunnel packets
   aka ServerXTR. The EID is an IPv6 EID that contains the HID.

ServerXTR: Is a data-plane only LISP protocol stack implementation, it
   is co-located with H3ServiceEID process. ServerXTR encapsulates and
   decapsulates packets to and from EdgeRTRs.

MobilityClient: Is an application that may be a part of a vehicle
   system, part of a navigation application, part of municipal
   application, or a street view consumer application. It has a
   light-weight LISP data-plane stack to packets - ClientXTR.

MobilityClient EID: Is the IPv6 EID used by the Mobility Clients.
   The destination of such packets are H3ServiceEIDs. The EID format
   is assigned as part of the MobilityClient mobility-network AAA.

ClientXTR: Is a data-plane only LISP protocol stack implementation
   co-located with the Mobility Client application. It encapsulates
   and decapsulates packets to and from EdgeRTRs.

EdgeRTR: Is the core scale and structure of the LISP mobility-network.
   EdgeRTRs connect H3ServiceEIDs and MobilityClient H3ServiceEID.
   EdgeRTRs also manage MobilityClients multicast registrations.
   EdgeRTRs aggregate MobilityClients/H3Services using tunnels to
   facilitate hosting-providers and mobile-providers for accessing the
   mobility-network. EdgeRTRs decapsulate packets from ClientXTRs,
   ServerXTRs and re-encapsulates packets to clients and servers
   tunnels. EdgeRTRs glean H3ServiceEIDs and MobilityClient
   EIDs when they decapsulates packets. EdgeRTRs store H3ServiceEIDs
   and route locations (RLOC) of where the H3ServiceEID is currently
   using the map-cache. Mappings are registered to the LISP mapping
   system.These mappings may be provisioned when H3Services are
   assigned EdgeRTRs. EdgeRTRs do not register MobilityClients' EIDs.
   Enterprises may provide their own EdgeRTRs to protect geo-privacy.

```
     Figure 2: H3.r15 state representation, H3.r9 state aggregation

Figure 2 above describes the following entities:
   - MobilityClientA detections used by MobilityClientB, and, vice versa
   - Clients: share information via Geolocation Services routed by LISP
   - ClientXTR (cXTR): tunnels packets over access networks to EdgeRTR
   - ServerXTR (sXTR): tunnels packets over cloud networks to EdgeRTR
   - H3-LISP Mobility Network: overlay which spans cXTRs to sXTRs
   - Uploads: routed to appropriate Geolocation Service by LISP
   - EdgeRTRs: perform multicast replication to EdgeRTRs and to cXTRs
   - Clients: receive geospatial detection updates via multicast channels

3. **Deployment Assumptions**

   The specification described in this document makes the following
   deployment assumptions:

   (1) Unique 64bit HID is associated with each H3 geo-spatial tile
   (2) MobilityClients and H3ServiceEIDs share grid based indexing
   (3) 64bit BDD state value is associated with each H3-indexed tile
   (4) Tile state is compiled 16 fields of 4-bits, or max 16 enums

```
 0       1       2       3       4       5       6       7

 +---------------------------------------------------------------+
```

   Figure 3: Nibble based representation, 16 fields x 16 enumerations

   We name the nibbles using hexadecimal index according to the
   position where the most significant nibble has index 0.
   Values are defined in section 8.

   Subscription of MobilityClients to mobility-network is renewed
   while driving. It is not intended as the basic connectivity.
   MobilityClients use DNS/AAA to obtain temporary EIDs/EdgeRTRs
   and use (LISP) data-plane tunnels to communicate using their
   temporary EIDs with the dynamically assigned EdgeRTRs. MobilityClient
   are otherwise unaware of the LISP network control plane and regard
   the data-plane tunnels as mobility network.

In order to get access to the mobility-network, MobilityClients first
authenticate with the Mobility AAA. DIAMETER [RFC6733] based AAA can
be used as a solution for the many types of mobility clients: vehicle
systems, driving applications, city and consumer applications.

ClientXTRs perform the following steps to use the mobility-network:
1) obtain the address of the mobility-network AAA server using DNS
2) obtain MobilityClientEIDs and EdgeRTRs from AAA DIAMETER server
3) renew authorization from AAA while using the mobility-network

```

```
   Figure 4: DNS and AAA Exchange for lisp mobility-network login

   Using such an AAA procedure we can ensure that:
   - MobilityClientEIDs serve as credentials with the EdgeRTRs
   - EdgeRTRs are provisioned to whitelist MobilityClient EIDs
   - EdgeRTRs are not tightly coupled to H3.r9 areas (privacy/balance)
   - MobilityClients do not need to update EdgeRTRs while driving

4. Mobility Clients Network Services

   The mobility-network functions as a standard LISP overlay.
   The overlay delivers unicast and multicast packets across:
    - multiple access-networks and radio-access specifications
    - multiple cloud edge providers, public, private, and hybrid

   We use data-plane XTRs in the stack of each mobility client/server.
   ClientXTRs and ServerXTRs are homed to one or more EdgeRTRs.
   This structure allows for MobilityClients to "show up" at any location
   behind any network provider in a given mobility-network admin/NAT
   domain, and for any H3ServiceEID to be instantiated, moved, or
   failed-over to any cluster in any cloud-provider. LISP overlay enables
   these roaming mobility-network elements to communicate uninterrupted.
   This quality is insured by the LISP RFCs. The determination of
   identities for MobilityClients to always refer to the correct
   H3ServiceEID is insured by H3 geo-spatial HIDs.

   In this specification we assume semi-random association between
   ClientXTRs and EdgeRTRs applied by the AAA procedure. We assume that
   in a given metro edge a pool of EdgeRTRs can distribute the Mobility
   Clients load randomly between them and that EdgeRTRs are topologically
   equivalent. Each RTR uses LISP to tunnel traffic to and from other
   EdgeRTRs forMobilityClient and H3Service exchanges.

To summarize the H3LISP mobility-network layout:

  (1) Mobility-Clients traffic is tunneled via data-plane ClientXTRs
      ClientXTRs are homed to EdgeRTR(s)
  (2) H3ServiceEID traffic is tunneled via data-plane ServerXTR
      ServerXTRs are homed to EdgeRTR(s)
  (3) EdgeRTRs use mapping service to resolve unicast EIDs to RTR RLOCs
      EdgeRTRs also register to (Source, Group) H3ServiceEID multicasts

      MobilityClients <> ClientXTR <Access Provider > EdgeRTR v
                                                               v
      v < < < <   LISP Mobility-Network Overlay < < < <   v
      v
      > > > > EdgeRTR <Cloud Provider> ServerXTR <> H3ServiceEID

  Figure 5: The Data Flow Between MobilityClients and H3ServiceEIDs

[5](#). Mobility Unicast and Multicast

Regardless of the way a given ClientXTR was associated with EdgeRTR,
an authenticated MobilityClient EID can send: [64bitH3.15ID ::
64bitState] detection to the H3.r9 H3ServiceEID. The H3.r9 EID can
be calculated by clients algorithmically from the H3.15 localization.

The ClientXTR encapsulates MobilityClient EID and H3ServiceEID from
the ClientXTR with the destination of the EdgeRTR RLOC LISP port.
EdgeRTRs then re-encapsulate annotation packets to remote EdgeRTR.
The remote EdgeRTR aggregating H3ServiceEIDs re-encapsulates
MobilityClient EID to the ServerXTR of the H3ServiceEID.

The headers consist of the following fields:

Outer headers size = 40 (IPv6) + 8 (UDP) + 8 (LISP) = 56
Inner headers size = 40 (IPv6) + 8 (UDP) + 4 (Nexagon Header) = 52
1500 (MTU) - 56 - 52 = 1392 bytes of effective payload size

Nexagon Header Type allows for kv tupples or vkkk flooding using the
same key and the same formats of key and value
Type 0:reserved
Type 1:key-value, key-value.. 1392 / (8 + 8) = 87 pairs
Type 2:value, key,key,key.. (1392 - 8) / 8 = 173 H3-R15 IDs
Type 3-255: unassigned
Nexagon Header GZIP field: 0x000 no compression, or GZIP version.
The compression refers to entire kv or vkkk payload.
Nexagon Header Reserved bits
Nexagon Header key and value count (in any format)

```
   Figure 6: Uploaded detections packet format

To Summarize Unicast Uploads:

   (1) MobilityClients can send detections localized to H3.r15 tile.
    These detections are sent to H3.r9 mobility H3ServiceEIDs
   (2) MobilityClient EID and H3ServiceEID HID are encapsulated:
          XTR <> RTR <> RTR <> XTR
   (3) RTRs re-encapsulate original source-dest to ServerXTRs
        ServerXTRs decapsulate packets to H3ServiceEID

   Each H3Service is also an IP Multicast Source used to update
   subscribers on the aggregate state of the H3.r15 tiles in the H3.r9
   area. We use [RFC8378] signal-free multicast to implement channels
   in the overlay. The mobility-network has many channels, with thousands
   subscribers per channel. MobilityClients driving through/subscribing
   to an H3.r9 area can explicitly issue an [RFC4604] MLDv2 in order to
   subscribe, or, may be subscribed implicitly by the EdgeRTR.

   The advantage of explicit client MLDv2 registration as [RFC8378]
   trigger is that clients manage their own mobility multicast per
   driving-direction vectors, and that it allows for otherwise silent
   non uploading clients. The advantage of EdgeRTR implicit registration
   is that less signaling required.

   MLDv2 signaling messages are encapsulated between the ClientXTR and
   EdgeRTR, therefore there is no requirement for the underlying network
   to support native multicast. If native access multicast is supported
   then MobilityClient registration to H3ServiceEID safety channels may
   be integrated with it, in which case mobile packet-core element
   supporting it will use this standard to register with the
   appropriate Geolocation Service channels in its area.

Multicast update packets are of the following structure:

```
 0                   1                   2                   3
 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1

```
      Figure 9: multicast update payload, value, key, key.. for larger areas

   The remote EdgeRTRs homing MobilityClients in turn replicate the
   packet to the MobilityClients registered with them.

   We expect an average of 600 H3.r15 tiles of the full 7^6 (~100K)
   possible in H3.r9 to be part of any road. The H3.r9 server can
   transmit the status of all 600 or just those with meaningful states
   based on updated SLA and policy.

   To Summarize:

    (1) EIDClients tune to H3.r9 mobility updates using [RFC8378]
         EIDClient issue MLDv2 registration to H3.r9 HIDs
         ClientXTRs encapsulate MLDv2 to EdgeRTRs who register (s,g).

    (2) ServerXTRs encapsulate updates to EdgeRTRs who map-resolve (s,g)
         RLOCs EdgeRTRs replicate mobility update and tunnel to registered
         EdgeRTRs Remote EdgeRTRs replicate updates to ClientXTRs.

6. Security Considerations

   The nexagon mobility-network is inherently secure and private.
   All information is conveyed using Geolocation Services.
   MobilityClients receive information only from geospatial channels
   originating from a trusted server. MobilityClients have no indication
   as to the origin of the raw data.

   In order to be able to use the nexagon mobility-network for a given
   period, the mobility clients go through a DNS/AAA stage by which they
   obtain their clientEID identifiers-credentials and the RLOCs of
   EdgeRTRs they may use as gateways to the network. This MobilityClient
   <> EdgeRTR interface is the most sensitive in this network to privacy
   and security considerations.

   The traffic on the MobilityClient<>EdgeRTR interface is tunneled, and
   its UDP content may be encrypted; still, the EdgeRTR will know based
   on the LISP headers alone the MobilityClient RLOC and H3-R9 (~0.1sqkm)
   geo-spatial area to which a given client uploads or subscribes to.

   For this reason we envision the ability of enterprise or groups of
   users to "bring their own" EdgeRTRs. For example a car OEM offering
   EdgeRTRs on behalf of its vehicles for use with Geolocation Services.
   BYO-RTR masks individual clients' RLOC to H3.r9 association and is
   pre-provisioned to be able to use the
   mapping system and be on a white-list of EdgeRTRs aggregating
   H3ServiceEIDs. If the EdgeRTR functionality is delivered by 5GCore UPF
   then the only entity which can correlate underlay IP, User, and Geo-
   location is the regulated carrier, which can do so anyway.

   Beyond this hop, the mapping system does not hold MobilityClientEIDs,
   and remote EdgeRTRs are only aware of MobilityClient ephemeral EIDs,
   not actual RLOC or any other mobile-device identifiers. EdgeRTRs
   register in the mapping (s,g) H3-R9 multicast groups. Which clients
   use which EdgeRTR is not in the mapping system, only the AAA server is
   aware of that. The H3ServiceEIDs themselves decrypt and parse actual
   H3-R15 annotations; they also consider during this MobilityClientEID
   credentials to avoid "fake-news", but again these are only temporary
   EIDs allocated to clients in order to be able to use the mobility
   network and not for their actual IP.

   H3Services are provisioned to their EdgeRTRs, in the EdgeRTRs, and
   optionally also in the mapping system.

In summary of main risk mitigations for the lisp-nexagon interface:

(1) tapping: all communications are through dynamic tunnels therefore
may be encrypted using IP-Sec or other supported point to point
underlay standards. These are not static tunnels but LISP re-tunneling
routers (RTRs) perform all nexagon Overlay aggregation.

(2) spoofing: it is very hard to guess a MobilityClientEID valid for
a short period of time. Clients and H3Services EIDs are whitelisted
in EdgeRTRs, Clients using the AAA procedure, H3Services via dev-ops.

(3) impersonating: efforts to use MobilityClients and H3Services RLOCs
should be caught by the underlying service provider edge and access
networks. EID impersonating is caught by EdgeRTR EID RLOC whitelist
mismatch.

(4) credibility: the interface crowd-sources geo-state and does not
assume to trust single detections. Credit history track to
MobilityClientEIDs by as part of normal H3Services fact checking,
aggregate scores affect AAA credentials.

(5) privacy: Only EdgeRTRs are aware of both clients' RLOC and
geo-location, only AAA is aware of client IDs credentials and credit
but not geo-location. Aggregate credit score span all H3Services
administratively without source.

7. Acknowledgments

8. IANA Considerations

This section provides guidance to the Internet Assigned Numbers
Authority (IANA) regarding registration of values related to the LISP
specification, in accordance with BCP 26 [RFC8126].

IANA is asked to create a registry named NEXAGON Parameters.

Such registry should be populated with the following sub registries.

State Enumeration Field 0x0: Traffic Direction:

Value	Description	Reference
0x0	Null	[This Document]
0x1	Lane North	[This Document]
0x2	Lane North + 30	[This Document]
0x3	Lane North + 60	[This Document]
0x4	Lane North + 90	[This Document]
0x5	Lane North + 120	[This Document]
0x6	Lane North + 150	[This Document]
0x7	Lane North + 180	[This Document]
0x8	Lane North + 210	[This Document]
0x9	Lane North + 240	[This Document]
0xA	Lane North + 270	[This Document]
0xB	Lane North + 300	[This Document]
0xC	Lane North + 330	[This Document]
0xD	Junction	[This Document]
0xE	Shoulder	[This Document]
0xF	Sidewalk	[This Document]

State Enumeration Field 0x1: Persistent Condition:

Value	Description	Reference
0x0	Null	[This Document]
0x1	Pothole Light	[This Document]
0x2	Pothole Deep	[This Document]
0x3	Speed-bump Low	[This Document]
0x4	Speed-bump High	[This Document]
0x5	Icy	[This Document]
0x6	Flooded	[This Document]
0x7	Snow-cover	[This Document]
0x8	Deep Snow	[This Document]
0x9	Cone	[This Document]
0xA	Gravel	[This Document]
0xB	Choppy	[This Document]
0xC	Blind-Curve	[This Document]
0xD	Steep	[This Document]
0xE	Low-bridge	[This Document]
0xF	Other	[This Document]

State Enumeration Field 0x2: Transient Condition:
+-------+-------------------+-----------------+
| Value | Description | Reference |
+-------+-------------------+-----------------+
0x0	Null	[This Document]
0x1	Jaywalker	[This Document]
0x2	Bike or Scooter	[This Document]
0x3	Stopped Vehicle	[This Document]
0x4	Moving on Shoulder	[This Document]
0x5	First Responder	[This Document]
0x6	Sudden Slowdown	[This Document]
0x7	Oversize Vehicle	[This Document]
0x8	Light/Sign Breach	[This Document]
0x9	Collision Light	[This Document]
0xA	Collision Severe	[This Document]
0xB	Collision Debris	[This Document]
0xC	Collision Course	[This Document]
0xD	Vehicle Hard Brake	[This Document]
0xE	Vehicle Sharp Turn	[This Document]
0xF	Freed-up Parking	[This Document]
+-------+-------------------+-----------------+

State Enumeration Field 0x3: Traffic-light Counter:

Value	Description	Reference
0x0	Null	[This Document]
0x1	1 Second to Green	[This Document]
0x2	2 Second to Green	[This Document]
0x3	3 Second to Green	[This Document]
0x4	4 Second to Green	[This Document]
0x5	5 Second to Green	[This Document]
0x6	6 Second to Green	[This Document]
0x7	7 Second to Green	[This Document]
0x8	8 Second to Green	[This Document]
0x9	9 Second to Green	[This Document]
0xA	10 Second to Green	[This Document]
0xB	20 Second to Green	[This Document]
0xC	30 Second to Green	[This Document]
0xD	60 Second to Green	[This Document]
0xE	Green Now	[This Document]
0xF	Red Now	[This Document]

State Enumeration Field 0x4: Impacted Tile:

Value	Description	Reference
0x0	Null	[This Document]
0x1	Epicenter	[This Document]
0x2	2 Tiles Away	[This Document]
0x3	3 Tiles Away	[This Document]
0x4	4 Tiles Away	[This Document]
0x5	5 Tiles Away	[This Document]
0x6	6 Tiles Away	[This Document]
0x7	7 Tiles Away	[This Document]
0x8	8 Tiles Away	[This Document]
0x9	9 Tiles Away	[This Document]
0xA	10 Tiles Away	[This Document]
0xB	20 Tiles Away	[This Document]
0xC	30 Tiles Away	[This Document]
0xD	60 Tiles Away	[This Document]
0xE	<100 Tiles Away	[This Document]
0xF	<200 Tiles Away	[This Document]

State Enumeration Field 0x5: Expected Duration:

Value	Description	Reference
0x0	Null	[This Document]
0x1	Next 1 Second	[This Document]
0x2	Next 5 Seconds	[This Document]
0x3	Next 10 Seconds	[This Document]
0x4	Next 20 Seconds	[This Document]
0x5	Next 40 Seconds	[This Document]
0x6	Next 60 Seconds	[This Document]
0x7	Next 2 Minutes	[This Document]
0x8	Next 3 Minutes	[This Document]
0x9	Next 4 Minutes	[This Document]
0xA	Next 5 Minutes	[This Document]
0xB	Next 10 Minutes	[This Document]
0xC	Next 15 Minutes	[This Document]
0xD	Next 30 Minutes	[This Document]
0xE	Next 60 Minutes	[This Document]
0xF	Next 24 Hours	[This Document]

State Enumeration Field 0x6: Lane Right Sign:
+-------+-------------------+-----------------+
| Value | Description | Reference |
+-------+-------------------+-----------------+
0x0	Null	[This Document]
0x1	Yield	[This Document]
0x2	Speed Limit	[This Document]
0x3	Straight Only	[This Document]
0x4	No Straight	[This Document]
0x5	Right Only	[This Document]
0x6	No Right	[This Document]
0x7	Left Only	[This Document]
0x8	No Left	[This Document]
0x9	Right Straight	[This Document]
0xA	Left Straight	[This Document]
0xB	No U Turn	[This Document]
0xC	No Left or U	[This Document]
0xD	Bike Lane	[This Document]
0xE	HOV Lane	[This Document]
0xF	Stop	[This Document]
+-------+-------------------+-----------------+

State Enumeration Field 0x7: Movement Sign:

Value	Description	Reference
0x0	Null	[This Document]
0x1	Keep Right	[This Document]
0x2	Keep Left	[This Document]
0x3	Stay in Lane	[This Document]
0x4	Do Not Enter	[This Document]
0x5	No Trucks	[This Document]
0x6	No Bikes	[This Document]
0x7	No Peds	[This Document]
0x8	One Way	[This Document]
0x9	Parking	[This Document]
0xA	No Parking	[This Document]
0xB	No Standing	[This Document]
0xC	No Passing	[This Document]
0xD	Loading Zone	[This Document]
0xE	Rail Crossing	[This Document]
0xF	School Zone	[This Document]

State Enumeration Field 0x8: Curves & Intersections:

Value	Description	Reference
0x0	Null	[This Document]
0x1	Turns Left	[This Document]
0x2	Turns Right	[This Document]
0x3	Curves Left	[This Document]
0x4	Curves Right	[This Document]
0x5	Reverses Left	[This Document]
0x6	Reverses Right	[This Document]
0x7	Winding Road	[This Document]
0x8	Hair Pin	[This Document]
0x9	Pretzel Turn	[This Document]
0xA	Cross Roads	[This Document]
0xB	Cross T	[This Document]
0xC	Cross Y	[This Document]
0xD	Circle	[This Document]
0xE	Lane Ends	[This Document]
0xF	Road Narrows	[This Document]

State Enumeration Field 0x9: Tile Traffic Speed:
+-------+-------------------+-----------------+
| Value | Description | Reference |
+-------+-------------------+-----------------+
0x0	Null	[This Document]
0x1	< 1 m/sec	[This Document]
0x2	< 2 m/sec	[This Document]
0x3	< 3 m/sec	[This Document]
0x4	< 4 m/sec	[This Document]
0x5	< 5 m/sec	[This Document]
0x6	< 6 m/sec	[This Document]
0x7	< 7 m/sec	[This Document]
0x8	< 8 m/sec	[This Document]
0x9	< 9 m/sec	[This Document]
0xA	< 10 m/sec	[This Document]
0xB	< 20 m/sec	[This Document]
0xC	< 30 m/sec	[This Document]
0xD	< 40 m/sec	[This Document]
0xE	< 50 m/sec	[This Document]
0xF	> 50 m/sec	[This Document]
+-------+-------------------+-----------------+

State Enumeration Field 0xA: Pedestrian Curb Density:

Value	Description	Reference
0x0	Null	[This Document]
0x1	100%	[This Document]
0x2	95%	[This Document]
0x3	90%	[This Document]
0x4	85%	[This Document]
0x5	80%	[This Document]
0x6	70%	[This Document]
0x7	60%	[This Document]
0x8	50%	[This Document]
0x9	40%	[This Document]
0xA	30%	[This Document]
0xB	20%	[This Document]
0xC	15%	[This Document]
0xD	10%	[This Document]
0xE	5%	[This Document]
0xF	No Peds	[This Document]

State enumeration fields 0xB, 0xC, 0xD, 0xE, 0xF, are unassigned.
IANA can assign them on a "First Come First Served" basis
according to [RFC8126].
