A YANG Data Model for LMAP Measurement Agents
draft-ietf-lmap-yang-12.txt

Abstract

This document defines a data model for Large-Scale Measurement Platforms (LMAP). The data model is defined using the YANG data modeling language.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on October 23, 2017.

[1.](#) Introduction

This document defines a data model for Large-Scale Measurement Platforms (LMAP) [[RFC7594](#)]. The data model is defined using the YANG [[RFC7950](#)] data modeling language. It is based on the LMAP Information Model [[I-D.ietf-lmap-information-model](#)].

[1.1.](#) Terminology

This document uses the LMAP terminology defined in [[RFC7594](#)].

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

1.2. Tree Diagrams

A simplified graphical representation of the data model is used in this document. The meaning of the symbols in these diagrams is as follows:

- o Brackets "[" and "]" enclose list keys.
- o Abbreviations before data node names: "rw" means configuration (read-write), "ro" means state data (read-only), and "w" means RPC input data (write-only).
- o Symbols after data node names: "?" means an optional node, "!" means a presence container, and "*" denotes a list and leaf-list.
- o Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").
- o Ellipsis ("...") stands for contents of subtrees that are not shown.

2. Data Model Overview

The LMAP framework has three basic elements: Measurement Agents, Controllers, and Collectors. Measurement Agents initiate the actual measurements, which are called Measurement Tasks in the LMAP terminology. The Controller instructs one or more MAs and communicates the set of Measurement Tasks an MA should perform and when. The Collector accepts Reports from the MAs with the Results from their Measurement Tasks.

The YANG data model for LMAP has been split into three modules:

1. The module `ietf-lmap-common.yang` provides common definitions such as LMAP specific data types.
2. The module `ietf-lmap-control.yang` defines the data structures exchanged between a Controller and Measurement Agents.
3. The module `ietf-lmap-report.yang` defines the data structures exchanged between Measurement Agents and Collectors.

As shown in Figure 1, a Controller, implementing `ietf-lmap-common.yang` and `ietf-lmap-control.yang` as a client, will instruct Measurement Agents, which implement `ietf-lmap-common.yang` and `ietf-lmap-control.yang` as servers. A Measurement Agent, implementing `ietf-lmap-common.yang` and `ietf-lmap-report.yang`, will send results to

a Collector, which implements `ietf-lmap-common.yang` and `ietf-lmap-report.yang` as a server.

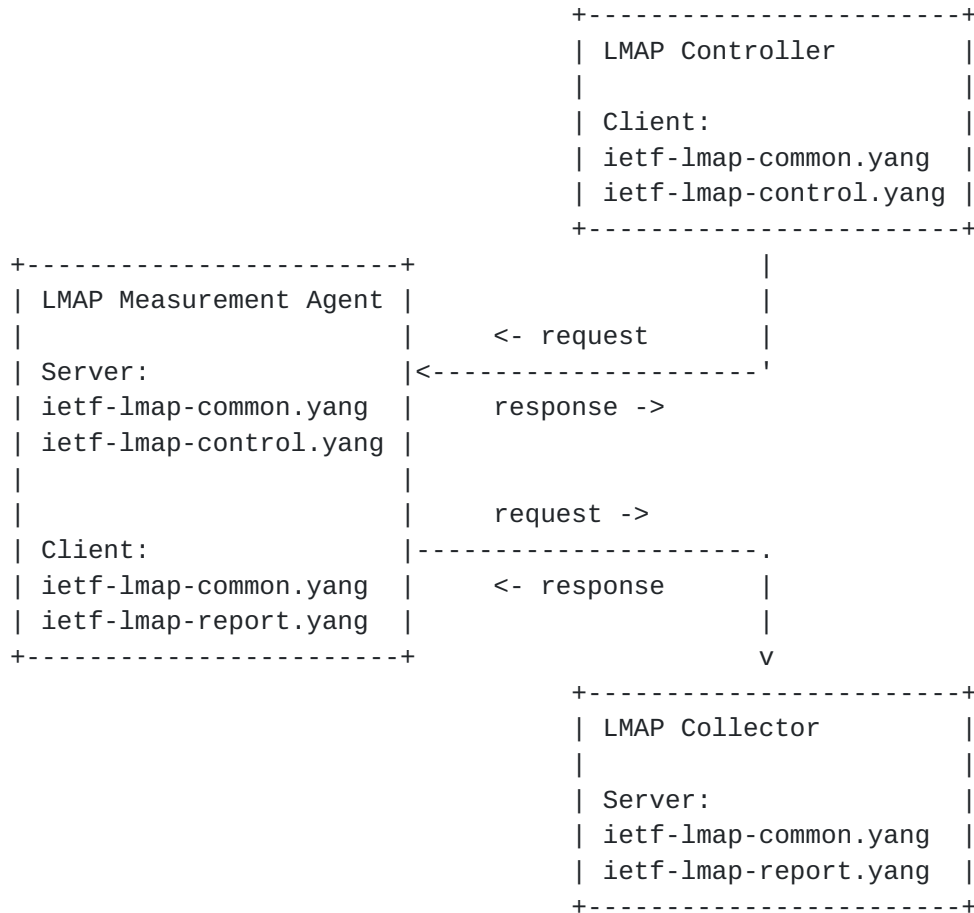

Figure 1: LMAP Controller, Measurement Agents, and Collector and the YANG modules they implement as client or server

The tree diagram below shows the structure of the control data model.

3. Relationship to the Information Model

The LMAP information model [[I-D.ietf-lmap-information-model](#)] is divided into six aspects. They are mapped into the YANG data model as explained below:

- o Pre-Configuration Information: This is not modeled explicitly since bootstrapping information is outside the scope of this data model. Implementations may use some of the Configuration Information also for bootstrapping purposes.

- o Configuration Information: This is modeled in the /lmap/agent subtree, the /lmap/schedules subtree, and the /lmap/tasks subtree described below. Some items have been left out because they are expected to be dealt with by the underlying protocol.
- o Instruction Information: This is modeled in the /lmap/suppressions subtree, the /lmap/schedules subtree, and the /lmap/tasks subtree described below.
- o Logging Information: Some of the logging information, in particular 'success/failure/warning messages in response to information updates from the Controller', will be handled by the protocol used to manipulate the lmap specific configuration. The LMAP data model defined in this document assumes that runtime logging information will be communicated using protocols that do not require a formal data model, e.g., the Syslog protocol defined in [\[RFC5424\]](#).
- o Capability and Status Information: Some of the capability and status information is modeled in the /lmap/capability subtree. The list of supported tasks is modeled in the /lmap/capabilities/task list. Status information about schedules and actions is included in the /lmap/schedules subtree. Information about network interfaces can be obtained from the ietf-interfaces YANG data model [\[RFC7223\]](#). Information about the hardware and the firmware can be obtained from the ietf-system YANG data model [\[RFC7317\]](#). A device identifier can be obtained from the ietf-hardware YANG data model [\[I-D.ietf-netmod-entity\]](#).
- o Reporting Information: This is modeled by the report data model to be implemented by the Collector. Measurement Agents send results to the Collector by invoking an RPC on the Collector.

These six information model aspects use a collection of common information objects. These common information objects are represented in the YANG data model as follows:

- o Schedules: Schedules are modeled in the /lmap/schedules subtree.
- o Channels: Channels are not modeled since the NETCONF server configuration data model [\[I-D.ietf-netconf-netconf-client-server\]](#) already provides a mechanism to configure NETCONF server channels.
- o Task Configurations: Configured tasks are modeled in the /lmap/tasks subtree.
- o Event Information: Event definitions are modeled in the /lmap/events subtree.

4. YANG Modules

4.1. LMAP Common YANG Module

This module imports definitions from [RFC6536] and it references [ISO-8601].

```
<CODE BEGINS> file "ietf-lmap-common@2017-04-21.yang"
module ietf-lmap-common {

    yang-version 1.1;
    namespace "urn:ietf:params:xml:ns:yang:ietf-lmap-common";
    prefix "lmap";

    import ietf-inet-types {
        prefix inet;
    }

    organization
        "IETF Large-Scale Measurement Platforms Working Group";

    contact
        "WG Web:  <http://tools.ietf.org/wg/lmap/>
        WG List:  <mailto:lmap@ietf.org>

        Editor:   Vaibhav Bajpai
                  <v.bajpai@jacobs-university.de>";

    description
        "This module provides common definitions used by the data
        models written for Large-Scale Measurement Platforms (LMAP).
        This module defines typedefs and groupings but no schema
        tree elements.";

    revision "2017-04-21" {
        description
            "Initial version";
        reference
            "RFC XXXX: A YANG Data Model for LMAP Measurement Agents";
    }

    /*
     * Typedefs
     */
```

```
typedef identifier {
  type string {
    length "1..max";
  }
  description
    "An string value used to name something.";
}

typedef tag {
  type string {
    length "1..max";
  }
  description
    "A tag consists of at least one character.";
}

typedef glob-pattern {
  type string {
    length "1..max";
  }
  description
    'A glob style pattern (following POSIX.2 fnmatch() without
    special treatment of file paths):

        *      matches a sequence of characters
        ?      matches a single character
        [seq]   matches any character in seq
        [!seq]  matches any character not in seq

    A backslash followed by a character matches the following
    character. In particular:

        \*      matches *
        \?      matches ?
        \\      matches \

    A sequence seq may be a sequence of characters (e.g., [abc]
    or a range of characters (e.g., [a-c]).';
}

5. Security Considerations

The YANG module defined in this memo is designed to be accessed via the NETCONF protocol [RFC6241]. The lowest NETCONF layer is the secure transport layer, and the mandatory to implement secure transport is SSH [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC5246].

The NETCONF access control model [RFC6536] provides the means to restrict access for particular NETCONF or RESTCONF users to a pre-configured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module which are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

```
/lmap/agent      This subtree configures general properties of
                  the measurement agent such as its identity, its
```

measurement point or controller timeout. This subtree should only have write access for the system responsible to configure the measurement agent.

`/lmap/tasks` This subtree configures the tasks that can be invoked by a controller. This subtree should only have write access for the system responsible to configure the measurement agent. Care must be taken to not expose tasks to a controller that can cause damage to the system or the network.

`/lmap/schedules` This subtree is used by a controller to define the schedules and actions that are executed when certain events occur. Unauthorized access can cause unwanted load on the device or network or it might direct measurement traffic to targets that become victims of an attack.

`/lmap/suppressions` This subtree is used by a controller to define suppressions that can temporarily disable the execution of schedules or actions. Unauthorized access can either disable measurements that should normally take place or it can cause measurements to take place during times when normally no measurements should take place.

`/lmap/events` This subtree is used by a controller to define events that trigger the execution of schedules and actions. Unauthorized access can either disable measurements that should normally take place or it can cause measurements to take place during times when normally no measurements should take place or at frequency that is higher than normally expected.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via `get`, `get-config` or `notification`) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

`/lmap/agent` This subtree provides information about the measurement agent. This information may be used to select specific targets for attacks.

<code>/lmap/capabilities</code>	This subtree provides information about the capabilities of the measurement agent, including its software version number and the tasks that it supports. This information may be used to execute targeted attacks against specific implementations.
<code>/lmap/schedules</code>	This subtree provides information about the schedules and their associated actions executed on the measurement agent. This information may be used to check whether attacks against the implementation are effective.
<code>/lmap/suppressions</code>	This subtree provides information about the suppressions that can be active on the measurement agent. This information may be used to predict time periods where measurements take place (or do not take place).

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

<code>/report</code>	The report operation is used to send locally collected measurement results to a remote collector. Unauthorized access may leak measurement results, including from passive measurements.
----------------------	--

The data model uses a number of identifiers that are set by the controller. Implementors may find these identifiers useful for the identification of resources, e.g., to identify objects in a filesystem providing temporary storage. Since the identifiers used by the YANG data model may allow characters that may be given special interpretation in a specific context, implementations must ensure that identifiers are properly mapped into safe identifiers.

The data model allows to specify options in the form of name value pairs that are passed to programs. Implementers ought to take care that option names and values are passed literally to programs. In particular, shell expansions that may alter option names and values must not be performed.

6. IANA Considerations

This document registers three URIs in the "IETF XML Registry" [[RFC3688](#)]. Following the format in [RFC 3688](#), the following registrations have been made.

Appendix A. Example Parameter Extension Module

Sometimes tasks may require complicated parameters that cannot easily be fit into options, i.e., a list of name/value pairs. In such a situation, it is possible to augment the `ietf-lmap-control.yang` and `ietf-lmap-report.yang` data models with definitions for more complex parameters. The following example module demonstrates this idea using the parameters of UDP latency metrics as an example (although UDP latency metric parameters do not really need such an extension module).

```
module example-ietf-ippm-udp-latency {

  namespace "urn:example:ietf-ippm-udp-latency";
  prefix "ippm-udp-latency";

  import ietf-inet-types {
    prefix inet;
  }
  import ietf-lmap-control {
    prefix "lmapc";
  }
  import ietf-lmap-report {
    prefix "lmapr";
  }

  grouping ippm-udp-latency-parameter-grouping {
    leaf src-ip {
      type inet:ip-address;
      description
        "The source IP address of the UDP measurement traffic.";
    }

    leaf src-port {
      type inet:port-number;
      description
        "The source port number of the UDP measurement traffic.";
    }

    leaf dst-ip {
      type inet:ip-address;
      description
```

```
    "The destination IP address of the UDP measurement traffic.";
}

leaf dst-port {
    type inet:port-number;
    description
        "The destination port number of the UDP measurement traffic.";
}

leaf poisson-lambda {
    type decimal64 {
        fraction-digits 4;
    }
    units "seconds";
    default 1.0000;
    description
        "The average interval for the poisson stream with a resolution
        of 0.0001 seconds (0.1 ms).";
}

leaf poisson-limit {
    type decimal64 {
        fraction-digits 4;
    }
    units "seconds";
    default 30.0000;
    description
        "The upper limit on the poisson distribution with a resolution
        of 0.0001 seconds (0.1 ms).";
}
}

augment "/lmapc:lmap/lmapc:schedules/lmapc:schedule/lmapc:action"
    + "/lmapc:parameters/lmapc:extension" {
    description
        "This augmentation adds parameters specific to IPPM UDP
        latency metrics to actions.";

    case "ietf-ippm-udp-latency" {
        uses ippm-udp-latency-parameter-grouping;
    }
}

augment "/lmapr:report/lmapr:input/lmapr:result"
    + "/lmapr:parameters/lmapr:extension" {
    description
        "This augmentation adds parameters specific to IPPM UDP
        latency metrics to reports.";
```

```
    case "ietf-ippm-udp-latency" {  
      uses ippm-udp-latency-parameter-grouping;  
    }  
  }  
}
```

[Appendix D.](#) Change History

Note to the RFC Editor: this section should be removed on publication as an RFC.

[D.1.](#) Non-editorial Changes since -07

- o Require yang-version 1.1 since we need leaf-lists supporting non-unique values in the report.
- o Merged the /lmap-state tree into the /lmap tree.
- o Marked state objects as mandatory.
- o Added /lmap/agent/report-group-id.

D.2. Non-editorial Changes since -06

- o Removed /lmap/agent/device-id and /lmap-state/agent/device-id, added pointer to the ietf-hardware YANG model.
- o Removed /lmap-state/agent/{hardware,firmware}, added pointer to the ietf-system YANG model.

D.3. Non-editorial Changes since -05

- o Update the example in an attempt to aligned it with the example in the information model.
- o Added an extension hook to reports so that task-specific parameters can be echoed back to the collector. Updated the example extension module accordingly.
- o Added text and Figure 1 to describe the function and purpose of the three YANG modules.
- o Added a cycle-number type definition.
- o Added the optional cycle-interval to event definitions.
- o Added tags that report additional capabilities of the measurement agent.
- o Added event time and cycle-number to the result report.
- o Renamed the metrics-grouping to registry-grouping.
- o Removed JSON encoding of the examples (they will go into the RESTCONF document).

D.4. Non-editorial Changes since -04

- o Tagged /lmap/tasks/task/program with nacm:default-deny-write.
- o Added /lmap-state/schedules/schedule/storage and /lmap-state/schedules/schedule/action/storage.
- o Removed suppress-by-default.
- o Moved the metric list from /report/result into /report/result/table.
- o Conflicts are now reported as a triple (schedule, action, task).

- o Replaced IPv4 address in the examples with IPv6 addresses.
- o Added result/status.

D.5. Non-editorial Changes since -03

- o Reworked the reporting data model to align it with the changes in the information model.

D.6. Non-editorial Changes since -02

- o Added a mechanism to enforce a runtime limit for schedules.
- o Added security considerations text warning about possible shell expansions of options.
- o Restricted all user-defined names and tags to `lmap:identifier`. Added security considerations text to make implementors aware of possible security issues if identifiers are naively mapped to say filesystem paths.
- o Schedules and actions now have tags (echoed to the collector) and suppression tags (used for suppression selection).
- o Introduced glob-style pattern to match tags.
- o Added an example module for IPPM udp latency metrics to demonstrate the usage of the extension mechanism.
- o Introduced parameters, an extension point for task/metric specific parameters defined in augmenting YANG modules.
- o Introduced the typedefs `event-ref`, `task-ref`, and `schedule-ref`.
- o Changed `schedule/event` to `schedule/start` and added the optional `schedule/stop` and `schedule/duration` leafs.

D.7. Non-editorial Changes since -01

- o Updated and split examples (config vs state vs report).
- o Refactored the definitions so that common definitions used by both the control and report data models are in the new module `ietf-lmap-common`.
- o A report is submitted via an RPC operation instead of using a notification.

- o The default execution mode is pipelined.
- o Clarified which action consumes data in sequential, pipelines, and parallel execution mode.
- o Added /lmap/agent/measurement-point, /lmap/agent/report-measurement-point, and /report/measurement-point to configure and report the measurement point.
- o Turned /lmap/suppression into a list /lmap/suppressions/suppression that uses a start and stop event to define the beginning and end of a suppression period.
- o Added controller-lost and controller-ok event choices to /lmap/events/event.
- o Added a metrics-grouping to identify entries in a metric registry and associated roles.
- o Added /lmap-state/schedules to report the status of schedules and their actions. Refactored /lmap-state/tasks to only report the task capabilities.

D.8. Non-editorial Changes since -00

- o A task can now reference multiple registry entries.
- o Schedules are triggered by Events instead of Timings; Timings are just one of many possible event sources.
- o Actions feed into other Schedules (instead of Actions within other Schedules).
- o Removed the notion of multiple task outputs.
- o Support for sequential, parallel, and pipelined execution of Actions.
