**YANG Model for OSPFv3 Extended LSAs**

## **Abstract**

This document defines a YANG data model augmenting the IETF OSPF YANG model to provide support for OSPFv3 Link State Advertisement (LSA) Extensibility as defined in RFC 8362. OSPFv3 Extended LSAs provide extensible TLV-based LSAs for the base LSA types defined in RFC 5340.

## **Status of This Memo**

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 3 March 2023.

### 1. Overview

YANG [[RFC7950](#)] is a data definition language used to define the contents of a conceptual data store that allows networked devices to be managed using NETCONF [[RFC6241](#)]. YANG is proving relevant beyond its initial confines, as bindings to other interfaces (e.g., ReST) and encodings other than XML (e.g., JSON) are being defined. Furthermore, YANG data models can be used as the basis for implementation of other interfaces, such as CLI and programmatic APIs.

This document defines a YANG data model augmenting the IETF OSPF YANG model [[I-D.ietf-ospf-yang](#)], which itself augments [[RFC8349](#)], to provide support for configuration and operational state for OSPFv3 Extended LSAs as defined in [[RFC8362](#)].

The YANG modules in this document conform to the Network Management Datastore Architecture (NMDA) [[RFC8342](#)].

#### 1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)] [[RFC8174](#)].

### 2. Tree Diagrams

This document uses the graphical representation of data models defined in [[RFC8340](#)].

### 3. OSPFv3 Extended LSAs

This document defines a model for the OSPFv3 Extended LSA feature. It is an augmentation of the OSPF base model provided support for OSPFv3 Link State Advertisement (LSA) Extensibility [[RFC8362](#)].

OSPFv3 Extended LSAs provide extensible TLV-based LSAs for the base LSA types defined in [[RFC5340](#)].

The OSPFv3 Extended LSA YANG module requires support for the OSPF base model [[I-D.ietf-ospf-yang](#)] which defines basic OSPF configuration and state. The OSPF YANG model augments the ietf-routing YANG model defined in [[RFC8022](#)]. The augmentations defined in the ietf-ospfv3-extended-lsa YANG model will provide global configuration, area configuration, and addition of OSPFv3 Extended LSAs to the Link State Database (LSDB) operational state.

## 5. Security Considerations

The YANG modules specified in this document define a schema for data that is designed to be accessed via network management protocols such as NETCONF [[RFC6241](#)] or RESTCONF [[RFC8040](#)]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [[RFC6242](#)]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [[RFC8446](#)].

The NETCONF access control model [[RFC6536](#)] provides the means to restrict access for particular NETCONF or RESTCONF users to a pre-configured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in `ietf-ospfv3-extended-lsa.yang` module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., `edit-config`) to these data nodes without proper protection can have a negative effect on network operations. There are the subtrees and data nodes and their sensitivity/vulnerability:

```
/ospf:ospf/extended-lsa-support  
/ospf:ospf/ospf:areas/ospf:area/extended-lsa-support - For OSPFv3 Extended LSAs, the ability to disable OSPFv3 Extended LSA support result in a denial of service.
```

Some of the readable data nodes in the `ietf-ospfv3-extended-lsa.yang` module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via `get`, `get-config`, or `notification`) to these data nodes. The exposure of the Link State Database (LSDB) will expose the detailed topology of the network and information beyond the scope of OSPF router. This may be undesirable since both due to the fact that exposure may facilitate other attacks. Additionally, network operators may consider their topologies to be sensitive confidential data.

## 6. IANA Considerations

This document registers a URI in the IETF XML registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration is requested to be made:

URI: `urn:ietf:params:xml:ns:yang:ietf-ospfv3-extended-lsa`  
Registrant Contact: The IESG.  
XML: N/A, the requested URI is an XML namespace.

### Figure 3

This document registers a YANG module in the YANG Module Names registry [[RFC6020](#)].

```
name: ietf-ospfv3-extended-lsa
namespace: urn:ietf:params:xml:ns:yang:ietf-ospfv3-extended-lsa
prefix: ospfv3-e-lsa
reference: RFC XXXX
```

### Figure 4

## 7. Acknowledgements

This document was produced using Marshall Rose's xml2rfc tool.

The YANG model was developed using the suite of YANG tools written and maintained by numerous authors.

Thanks much to Tom Petch for his review and comments.
