IGP extension for PCEP security capability support in PCE discovery

Abstract

   When a Path Computation Element (PCE) is a Label Switching Router
   (LSR) participating in the Interior Gateway Protocol (IGP), or even
   a server participating in the IGP, its presence and path computation
   capabilities can be advertised using IGP flooding. The IGP
   extensions for PCE discovery (RFC 5088 and RFC 5089) define a method
   to advertise path computation capabilities using IGP flooding for
   OSPF and IS-IS respectively. However these specifications lack a
   method to advertise PCE Communication Protocol (PCEP) security
   (e.g., Transport Layer Security (TLS), TCP Authentication Option
   (TCP-AO)) support capability.

   This document defines capability flag bits for the PCE-CAP-FLAGS
   sub-TLV that can be announced as an attribute in the IGP
   advertisement to distribute PCEP security support information. In
   addition, this document updates RFC 5088 and RFC 5089 to allow
   advertisement of a Key ID or Key Chain Name Sub-TLV to support TCP-
   AO security capability. Further, this document updates RFC 8231 and
   RFC 8306.

Status of This Memo

This Internet-Draft will expire on 14 April 2023.

1. Introduction

As described in [RFC5440], Path Computation Element Communication
Protocol (PCEP) communication privacy and integrity are important
issues, as an attacker that intercepts a PCEP message could obtain
sensitive information related to computed paths and resources.
Authentication and integrity checks allow the receiver of a PCEP
message to know that the message genuinely comes from the node that
purports to have sent it and to know whether the message has been
modified.

Among the possible solutions mentioned in that document, Transport
Layer Security (TLS) [RFC8446] provides support for peer
authentication, and message encryption and integrity while TCP
Authentication Option (TCP-AO) [RFC5925] and Cryptographic
Algorithms for TCP-AO [RFC5926] offer significantly improved
security for applications using TCP. As specified in section 4 of
[RFC8253], in order for a Path Computation Client (PCC) to establish
a connection with a PCE server using TLS or TCP-AO, the PCC needs to
know whether PCE server supports TLS or TCP-AO as a secure
transport.

[RFC5088] and [RFC5089] define a method to advertise path
computation capabilities using IGP flooding for OSPF and IS-IS
respectively. However, these specifications lack a method to
advertise PCEP security (e.g., TLS) support capability.

This document defines capability flag bits for the PCE-CAP-FLAGS
sub-TLV that can be announced as attributes in the IGP advertisement
to distribute PCEP security support information. In addition, this
document updates [RFC5088] and [RFC5089] to allow advertisement of a
Key ID or Key Chain Name Sub-TLV to support TCP-AO security
capability.

As per [RFC5088], the IANA created a top-level OSPF registry, the
"Path Computation Element (PCE) Capability Flags" registry. This
document updates [RFC5088] and moves the registry to "Interior
Gateway Protocol (IGP) Parameters". [RFC5089] states that the IS-IS
uses the same registry as OSPF. This document updates [RFC5089] to
refer to the new IGP registry. Further, this document updates
[RFC8231] where it references the registry location as "Open
Shortest Path First (OSPF) Parameters" registry to "Interior Gateway
Protocol (IGP) Parameters" registry. This document updates [RFC8306]
where it uses the term "OSPF PCE Capability Flag" and request
assignment from OSPF Parameters registry with "PCE Capability Flag"
and the IGP Parameters registry.

Note that [RFC5557] uses the term "OSPF registry" instead of the "IGP registry" whereas [RFC8623] and [RFC9168] uses the term "OSPF Parameters" instead of "IGP Parameters".

Note that the PCEP Open message exchange is another way to discover PCE capabilities information, but in this instance, the TCP security related key parameters need to be known before the PCEP session is established and the PCEP Open messages are exchanged. Thus, the use of the PCE discovery and capabilities advertisement of the IGP needs to be leveraged.

2. Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. IGP extension for PCEP security capability support

[RFC5088] defines a PCE Discovery (PCED) TLV carried in an OSPF Router Information Link State Advertisement (LSA) as defined in [RFC7770] to facilitate PCE discovery using OSPF. This document defines two capability flag bits in the OSPF PCE Capability Flags to indicate TCP Authentication Option (TCP-AO) support [RFC5925] [RFC5926] and PCEP over TLS support [RFC8253] respectively.

Similarly, [RFC5089] defines the PCED sub-TLV for use in PCE discovery using IS-IS. This document will use the same flag for the OSPF PCE Capability Flags sub-TLV to allow IS-IS to indicate TCP Authentication Option (TCP-AO) support, PCEP over TLS support respectively.

The IANA assignments for shared OSPF and IS-IS Security Capability Flags are documented in Section 8.1 ("PCE Capability Flags") of this document.

3.1. Use of PCEP security capability support for PCE discovery

TCP-AO, PCEP over TLS support flag bits are advertised using IGP flooding.

  *PCE supports TCP-AO: IGP advertisement SHOULD include TCP-AO
   support flag bit.

  *PCE supports TLS: IGP advertisement SHOULD include PCEP over TLS
   support flag bit.

If the PCE supports multiple security mechanisms, it SHOULD include all corresponding flag bits in its IGP advertisement.

A client's configuration MAY indicate that support for a given security capability is required. If a client is configured to require that its PCE server supports TCP-AO, the client MUST verify that the TCP-AO flag bit in the PCE-CAP-FLAGS sub-TLV for a given server is set before it opens a connection to that server. Similarly, if the client is configured to require that its PCE server supports TLS, the client MUST verify that the PCEP over TLS support flag bit in the PCE-CAP-FLAGS sub-TLV for a given server is set before it opens a connection to that server.

3.2. KEY-ID Sub-TLV

The KEY-ID sub-TLV specifies an identifier that can be used by the PCC to identify the TCP-AO key [RFC5925] (referred to as KeyID).

3.2.1. IS-IS

The KEY-ID sub-TLV MAY be present in the PCED sub-TLV carried within the IS-IS Router CAPABILITY TLV when the capability flag bit of PCE-CAP-FLAGS sub-TLV in IS-IS is set to indicate TCP Authentication Option (TCP-AO) support.

The KEY-ID sub-TLV has the following format:

    Type: 6

    Length: 1

    KeyID: The one octet Key ID as per [RFC5925] to uniquely identify the Master Key Tuple (MKT).

3.2.2. OSPF

Similarly, this sub-TLV MAY be present in the PCED TLV carried within OSPF Router Information LSA when the capability flag bit of PCE-CAP-FLAGS sub-TLV in OSPF is set to indicate TCP-AO support.

The format of KEY-ID sub-TLV is as follows:

```
                      1                   2                   3
  0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
 +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
 |            Type = 6           |              Length           |
 +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
 |    KeyID     |                 Reserved                       |
 +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

   Type: 6

   Length: 4

   KeyID: The one octet Key ID as per [RFC5925] to uniquely identify
   the Master Key Tuple (MKT).

   Reserved: MUST be set to zero while sending and ignored on
   receipt.

3.3. KEY-CHAIN-NAME Sub-TLV

   The KEY-CHAIN-NAME sub-TLV specifies a keychain name that can be
   used by the PCC to identify the keychain. The keychain name could be
   manually configured via CLI or installed in the YANG datastore (see
   [RFC8177]) at the PCC.

3.3.1. IS-IS

   The KEY-CHAIN-NAME sub-TLV MAY be present in the PCED sub-TLV
   carried within the IS-IS Router CAPABILITY TLV when the capability
   flag bit of the PCE-CAP-FLAGS sub-TLV in IS-IS is set to indicate
   TCP Authentication Option (TCP-AO) support.

   The KEY-CHAIN-NAME sub-TLV has the following format:

   Type: 7

   Length: Variable, encodes the length of the value field.

   Key Name: The Key Chain Name contains a string of 1 to 255 octets
   to be used to identify the key chain. It MUST be encoded using
   UTF-8. A receiving entity MUST NOT interpret invalid UTF-8
   sequences and ignore them. This field is not NULL terminated.
   UTF-8 "Shortest Form" encoding is REQUIRED to guard against the
   technical issues outlined in [UTR36].

3.3.2. OSPF

   Similarly, this sub-TLV MAY be present in the PCED TLV carried
   within the OSPF Router Information LSA when the capability flag bit
   of PCE-CAP-FLAGS sub-TLV in OSPF is set to indicate TCP-AO support.

The sub-TLV MUST be zero-padded so that the sub-TLV is 4-octet aligned.

The format of KEY-CHAIN-NAME sub-TLV is as follows:

```
                    1                   2                   3
 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|              Type = 7         |             Length            |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                                                               |
//                       Key Chain Name                        //
|                                                               |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

Type: 7

Length: Variable, padding is not included in the Length field

Key Name: The Key Chain Name contains a string of 1 to 255 octets to be used to identify the key chain. It MUST be encoded using UTF-8. A receiving entity MUST NOT interpret invalid UTF-8 sequences and ignore them. This field is not NULL terminated. UTF-8 "Shortest Form" encoding is REQUIRED to guard against the technical issues outlined in [UTR36]. The sub-TLV MUST be zero-padded so that the sub-TLV is 4-octet aligned.

4. Update to RFCs

Section 4 of [RFC5088] states that no new sub-TLVs will be added to the PCED TLV, and no new PCE information will be carried in the Router Information LSA. This document updates [RFC5088] by allowing the two sub-TLVs defined in this document to be carried in the PCED TLV advertised in the Router Information LSA.

Section 4 of [RFC5089] states that no new sub-TLVs will be added to the PCED TLV, and no new PCE information will be carried in the Router CAPABLITY TLV. This document updates [RFC5089] by allowing the two sub-TLVs defined in this document to be carried in the PCED TLV advertised in the Router CAPABILITY TLV.

This introduction of additional sub-TLVs should be viewed as an exception to the [RFC5088][RFC5089] policy, justified by the requirement to discover the PCEP security support prior to establishing a PCEP session. The restrictions defined in [RFC5088][RFC5089] should still be considered to be in place. If in the future new advertisements are required, alternative mechanisms such as using [RFC6823] or [I-D.ietf-lsr-ospf-transport-instance] should be considered.

The registry for the PCE Capability Flags assigned in section 8.3 of [RFC5557], section 8.1 of [RFC8231], section 6.9 of [RFC8306], section 11.1 of [RFC8623], and section 10.5 of [RFC9168] has changed to the IGP Parameters "Path Computation Element (PCE) Capability Flags" registry created in this document.

5. Backward Compatibility Considerations

An LSR that does not support the IGP PCE capability bits specified in this document silently ignores those bits.

An LSR that does not support the KEY-ID and KEY-CHAIN-NAME sub-TLVs specified in this document silently ignores these sub-TLVs.

IGP extensions defined in this document do not introduce any new interoperability issues.

6. Management Considerations

Manageability considerations for PCE Discovery are addressed in Section 4.10 of [RFC4674] and Section 9 of [RFC5088] [RFC5089].

6.1. Control of Policy and Functions

A PCE implementation SHOULD allow the following parameters to be configured on the PCE:

  *support for TCP-AO

  *the KeyID used by TCP-AO

  *Key Chain Name

  *support for TLS

6.2. Information and Data Model

The YANG model for PCEP [I-D.ietf-pce-pcep-yang] supports PCEP security parameters (key, key chain, and TLS).

6.3. Liveness Detection and Monitoring

Normal operations of the IGP meet the requirements for liveness detection and monitoring.

6.4. Verify Correct Operations

The correlation of PCEP security information advertised against information received can be achieved by comparing the information in

the PCED sub-TLV received by the PCC with that stored at the PCE
using the PCEP YANG.

6.5. Requirements on Other Protocols and Functional Components

There are no new requirements on other protocols.

6.6. Impact on Network Operations

Frequent changes in PCEP security information advertised in the PCED
sub-TLV may have a significant impact on IGP and might destabilize
the operation of the network by causing the PCCs to reconnect
sessions with PCE(s). Section 4.10.4 of [RFC4674] and Section 9.6 of
[RFC5088] [RFC5089] list techniques that are applicable to this
document as well.

7. Security Considerations

Security considerations as specified by [RFC5088] and [RFC5089] are
applicable to this document.

As described in Section 10.2 of [RFC5440], an PCEP speaker MUST
support TCP MD5 [RFC2385], so no capability advertisement is needed
to indicate support. However, as noted in [RFC6952], TCP MD5 has
been obsoleted by TCP-AO [RFC5925] because of security concerns.
However, TCP-AO is not widely implemented and so it is, therefore,
RECOMMENDED (per [RFC8253] which updates [RFC5440]) that PCEP is
secured using TLS. An implementation SHOULD offer at least one of
the two security capabilities defined in this document.

The information related to PCEP security is sensitive and due care
needs to be taken by the operator. This document defines new
capability bits that are susceptible to a downgrade attack by
setting them to zero. The content of Key ID or Key Chain Name Sub-
TLV can be altered to enable an on-path attack. Thus, before
advertising the PCEP security parameters, using the mechanism
described in this document, the IGP MUST be known to provide
authentication and integrity for the PCED TLV using the mechanisms
defined in [RFC5304], [RFC5310] or [RFC5709].

Moreover, as stated in the Security Considerations of [RFC5088] and
[RFC5089], there are no mechanisms defined in OSPF or IS-IS to
protect the confidentiality of the PCED TLV. For this reason, the
operator must ensure that no private data is carried in the TLV,
e.g. that key-ids or key-chain names do not reveal sensitive
information about the network.

8. IANA Considerations

8.1. PCE Capability Flags

IANA is requested to move the "Path Computation Element (PCE) Capability Flags" registry from the "Open Shortest Path First v2 (OSPFv2) Parameters" grouping to the "Interior Gateway Protocol (IGP) Parameters" grouping.

IANA is requested to make the following additional assignments from the "Path Computation Element (PCE) Capability Flags" registry.

```
  Bit             Capability Description  Reference
  xx              TCP-AO Support          [This.I.D]
  xx              PCEP over TLS support   [This.I.D]
```

The grouping is located at: https://www.iana.org/assignments/igp-parameters/igp-parameters.xhtml.

8.2. PCED sub-TLV Type Indicators

The PCED sub-TLVs were defined in [RFC5088] and [RFC5089], but they did not create a registry for it. This document requests IANA to create a new registry called "PCED sub-TLV type indicators" under the "Interior Gateway Protocol (IGP) Parameters" grouping. The registration policy for this registry is "Standards Action" [RFC8126]. Values in this registry come from the range 0-65535.

This registry should be populated with:

```
  Value           Description               Reference
  0               Reserved                  [This.I.D][RFC5088]
  1               PCE-ADDRESS               [This.I.D][RFC5088]
  2               PATH-SCOPE                [This.I.D][RFC5088]
  3               PCE-DOMAIN                [This.I.D][RFC5088]
  4               NEIG-PCE-DOMAIN           [This.I.D][RFC5088]
  5               PCE-CAP-FLAGS             [This.I.D][RFC5088]
  6               KEY-ID                    [This.I.D]
  7               KEY-CHAIN-NAME            [This.I.D]
```

This registry is used by both the OSPF PCED TLV and the IS-IS PCED sub-TLV.

This grouping is located at: https://www.iana.org/assignments/igp-parameters/igp-parameters.xhtml.

9. Acknowledgments

The authors of this document would also like to thank Acee Lindem, Julien Meuric, Les Ginsberg, Ketan Talaulikar, Tom Petch, Aijun Wang, Adrian Farrel for the review and comments.

The authors would also like to special thank Michale Wang for his major contributions to the initial version.

Thanks to John Scudder for providing an excellent AD review. Thanks to Carlos Pignataro, Yaron Sheffer, Ron Bonica, and Will (Shucheng) LIU for directorate reviews.

Thanks to Lars Eggert, Robert Wilton, Roman Danyliw, Eric Vyncke, Paul Wouters, Murray Kucherawy, and Warren Kumari for IESG reviews.
