YANG Data Model for MPLS LDP
[draft-ietf-mpls-ldp-yang-06](#)

Abstract

This document describes a YANG data model for Multi-Protocol Label Switching (MPLS) Label Distribution Protocol (LDP). The model also serves as the base model to define Multipoint LDP (mLDP) model.

The YANG modules in this document conform to the Network Management Datastore Architecture (NMDA).

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on December 2, 2019.

[1. Introduction](#)

The Network Configuration Protocol (NETCONF) [[RFC6241](#)] is one of the network management protocols that defines mechanisms to manage network devices. YANG [[RFC6020](#)] [[RFC7950](#)] is a modular language that represents data structures in an XML tree format, and is used as a data modelling language for the NETCONF.

This document introduces a YANG data model for MPLS Label Distribution Protocol (LDP) [[RFC5036](#)]. This model also covers LDP IPv6 [[RFC7552](#)] and LDP capabilities [[RFC5561](#)] specifications.

The data model is defined for following constructs that are used for managing the protocol:

- o Configuration
- o Operational State
- o Executables (Actions)
- o Notifications

This document is organized to define the data model for each of the above constructs in the sequence as listed above.

[1.1. Base and Extended](#)

The configuration and state items are divided into following two broad categories:

- o Base
- o Extended

The "base" category contains the basic and fundamental features that are covered in LDP base specification [[RFC5036](#)] and constitute the minimum requirements for a typical base LDP deployment. Whereas, the "extended" category contains all other non-base features. All the items in a base category are mandatory and hence no "if-feature" is allowed under the "base" category model. The base and extended categories are defined in their own modules as described later.

Raza, et al.

Expires December 2, 2019

[Page 3]

The example of base feature includes the configuration of LDP lsr-id, enabling LDP interfaces, setting password for LDP session etc., whereas the examples of extended feature include inbound/outbound label policies, igp sync, downstream-on-demand etc. This is worth highlighting that LDP IPv6 [[RFC7552](#)] is also categorized as an extended feature.

While "base" model support will suffice for small deployments, it is expected that large deployments will require not only the "base" module support from the vendors but also the support for "extended" model for some extended feature(s) of interest.

[2. Specification of Requirements](#)

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

In this document, the word "IP" is used to refer to both IPv4 and IPv6, unless otherwise explicitly stated. For example, "IP address family" means and be read as "IPv4 and/or IPv6 address family"

[3. Overview](#)

This document defines two new modules for LDP YANG support:

- o "ietf-mpls-ldp" module that models the base LDP features and augments /rt:routing/rt:control-plane-protocols defined in [[RFC8349](#)]
- o extended "ietf-mpls-ldp-extended" module that models the extended LDP features and augments the base LDP

It is to be noted that mLDP data model [[I-D.ietf-mpls-mldp-yang](#)] augments LDP base and extended models to model the base and extended mLDP features respectively.

There are four main containers in our module(s):

- o Read-Write parameters for configuration (Discussed in [Section 5](#))
- o Read-only parameters for operational state (Discussed in [Section 6](#))
- o Notifications for events (Discussed in [Section 7](#))

Raza, et al.

Expires December 2, 2019

[Page 4]

- o RPCs for executing commands to perform some action (Discussed in [Section 8](#))

The modeling in this document conforms to the Network Management Datastore Architecture (NMDA) defined in [[RFC8342](#)]. The operational state data is combined with the associated configuration data in the same hierarchy [[RFC8407](#)]. When protocol states are retrieved from the NMDA operational state datastore, the returned states cover all "config true" (rw) and "config false" (ro) nodes defined in the schema.

Following diagram depicts high level LDP yang tree organization and hierarchy:

```
+-- rw routing
    +-+ rw control-plane-protocols
        +-+ rw mpls-ldp
            +-+ rw ...
                +-+ rw ...                                // base
                |    +-+ rw ...
                |    +-+ ro ...
                |    +-+
                +-+ ro ...
                |    +-+ ro ...
                |    +-+ ro ...
                |    +-+
                +-+ rw ldp-ext: ....      // extended
                |    +-+ rw ...
                |    +-+ ro ...
                |    +-+
                +-+ ro ...
                    +-+ ro ...
                    +-+ ro ...
```

rpcs:

```
    +-+ x mpls-ldp-some_action
    +-+ x . . . . .
```

notifications:

```
    +-+ n mpls-ldp-some_event
    +-+ n . . .
```

[Page 5]

Before going into data model details, it is important to take note of the following points:

- o This module aims to address only the core LDP parameters as per RFC specification, as well as some widely deployed non-RFC features (such as label policies, session authentication etc). Any vendor specific feature should be defined in a vendor-specific augmentation of this model.
- o Multi-topology LDP [[RFC7307](#)] is beyond the scope of this document.
- o This module does not cover any applications running on top of LDP, nor does it cover any OAM procedures for LDP.
- o This model is a VPN Forwarding and Routing (VRF)-centric model. It is important to note that [[RFC4364](#)] defines VRF tables and default forwarding tables as different, however from a yang modelling perspective this introduces unnecessary complications, hence we are treating the default forwarding table as just another VRF.
- o A "network-instance", as defined in [[RFC8529](#)], refers to a VRF instance (both default and non-default) within the scope of this model.
- o This model supports two address-families, namely "ipv4" and "ipv6".
- o This model assumes platform-wide label space (i.e. label space Id of zero). However, when Upstream Label assignment [[RFC6389](#)] is in use, an upstream assigned label is looked up in a Context-Specific label space as defined in [[RFC5331](#)].
- o The label and peer policies (including filters) are defined using a prefix-list. When used for a peer policy, the prefix refers to the LSR Id of the peer. The prefix-list is referenced from routing-policy model as defined in [[I-D.ietf-rtgwg-policy-model](#)].
- o This model uses the terms LDP "neighbor"/"adjacency", "session", and "peer" with the following semantics:
 - * Neighbor/Adjacency: An LDP enabled LSR that is discovered through LDP discovery mechanisms.
 - * Session: An LDP neighbor with whom a TCP connection has been established.

- * Peer: An LDP session which has successfully progressed beyond its initialization phase and is either already exchanging the bindings or is ready to do so.

It is to be noted that LDP Graceful Restart mechanisms defined in [[RFC3478](#)] allow keeping the exchanged bindings for some time after a session goes down with a peer. We call such a state belonging to a "stale" peer -- i.e. keeping peer bindings from a peer with whom currently there is either no connection established or connection is established but GR session is in recovery state.

When used in this document, the above terms will refer strictly to the semantics and definitions defined for them.

A simplified graphical tree representation of full LDP YANG data model is presented in Figure 2, whereas LDP configuration (base and extended), state (base and extended), notification, and rpc are graphically represented in Figure 5, Figure 6, Figure 8, Figure 9, Figure 15, and Figure 16 respectively. The meaning of the symbols in these tree diagrams is defined in [[RFC8340](#)].

The actual base and extended model definition in YANG is captured in [Section 9](#).

While presenting the YANG tree view and actual .yang specification, this document assumes readers' familiarity with the concepts of YANG modeling, its presentation and its compilation.

[4. Consolidated Tree](#)

Following is a consolidated tree representation of configuration, state, notification, and rpc items under LDP base and extended.

```

5. Configuration

This specification defines the configuration parameters for base LDP as specified in [[RFC5036](#)] and LDP IPv6 [[RFC7552](#)]. Moreover, it incorporates provisions to enable LDP Capabilities [[RFC5561](#)], and defines some of the most significant and commonly used capabilities such as Typed Wildcard FEC [[RFC5918](#)], End-of-LIB [[RFC5919](#)], and LDP Upstream Label Assignment [[RFC6389](#)].

This model augments /rt:routing/rt:control-plane-protocols that is defined in [[RFC8349](#)] and follows NMDA as mentioned earlier.

Following is the high-level configuration organization for base LDP:

```
augment /rt:routing/rt:control-plane-protocols:  
    +-+ mpls-ldp  
        +-+ global  
            |  
            |    +-+ ...  
            |    +-+ ...  
            |    +-+ address-families  
            |    |    +-+ ipv4  
            |    |    +-+ ...  
            |    |    +-+ ...  
            |    +-+ capability  
            |    +-+ ...  
            |    +-+ ...  
        +-+ discovery  
            |    +-+ interfaces  
            |    |    +-+ ...  
            |    |    +-+ ...  
            |    |    +-+ interface* [interface]  
            |    |    +-+ ...  
            |    |    +-+ address-families  
            |    |    +-+ ipv4  
            |    |    +-+ ...  
            |    |    +-+ ...  
        +-+ targeted  
            |    +-+ ...  
            |    +-+ address-families  
            |    +-+ ipv4  
            |        +-+ target* [adjacent-address]  
            |        +-+ ...  
            |        +-+ ...  
    +-+ peers  
        +-+ ...  
        +-+ ...  
        +-+ peer* [lsrc-id label-space-id]  
            +-+ ...  
            +-+ ...
```

Figure 3

Following is the high-level configuration organization for extended LDP:

```
augment /rt:routing/rt:control-plane-protocols:  
  +-+ mpls-ldp  
    +-+ global  
      |  +-+ ...  
      |  +-+ ...  
      |  +-+ address-families  
        |  |  +-+ ipv4  
        |  |  |  +-+ ...  
        |  |  |  +-+ ...

```

Figure 4

Given the configuration hierarchy, the model allows inheritance such that an item in a child tree is able to derive value from a similar or related item in one of the parent. For instance, hello holdtime can be configured per-VRF or per-VRF-interface, thus allowing inheritance as well flexibility to override with a different value at any child level.

[5.1. Configuration Tree](#)

[5.1.1. Base](#)

Following is a simplified graphical representation of the data model for LDP base configuration

```

module: ietf-mpls-ldp
augment /rt:routing/rt:control-plane-protocols:

Figure 6

[5.2. Configuration Hierarchy](#)

The LDP configuration container is logically divided into following high-level config areas:

- Per-VRF parameters
 - o Global parameters
 - o Per-address-family parameters
 - o LDP Capabilities parameters
 - o Hello Discovery parameters
 - interfaces
 - Per-interface:
 - Global
 - Per-address-family
 - targeted
 - Per-target
 - o Peer parameters
 - Global
 - Per-peer
 - Per-address-family
 - o Forwarding parameters

Figure 7

Following subsections briefly explain these configuration areas.

[5.2.1. Per-VRF parameters](#)

LDP module resides under an network-instance and the scope of any LDP configuration defined under this tree is per network-instance (per-VRF). This configuration is further divided into sub categories as follows.

Raza, et al.

Expires December 2, 2019

[Page 23]

5.2.1.1. Per-VRF global parameters

There are configuration items that are available directly under a VRF instance and do not fall under any other sub tree. Example of such a parameter is LDP LSR id that is typically configured per VRF. To keep legacy LDP features and applications working in an LDP IPv4 networks with this model, this document recommends an operator to pick a routable IPv4 unicast address as an LSR Id.

5.2.1.2. Per-VRF Capabilities parameters

This container falls under global tree and holds the LDP capabilities that are to be enabled for certain features. By default, an LDP capability is disabled unless explicitly enabled. These capabilities are typically used to negotiate with LDP peer(s) the support/non-support related to a feature and its parameters. The scope of a capability enabled under this container applies to all LDP peers in the given VRF instance. There is also a peer level capability container that is provided to override a capability that is enabled/specify at VRF level.

5.2.1.3. Per-VRF Per-Address-Family parameters

Any LDP configuration parameter related to IP address family (AF) whose scope is VRF wide is configured under this tree. The examples of per-AF parameters include enabling LDP for an address family, prefix-list based label policies, and LDP transport address.

5.2.1.4. Per-VRF Hello Discovery parameters

This container is used to hold LDP configuration related to Hello and discovery process for both basic (link) and extended (targeted) discovery.

The "interfaces" is a container to configure parameters related to VRF interfaces. There are parameters that apply to all interfaces (such as hello timers), as well as parameters that can be configured per-interface. Hence, an interface list is defined under "interfaces" container. The model defines parameters to configure per-interface non AF related items, as well as per-interface per-AF items. The example of former is interface hello timers, and example of latter is enabling hellos for a given AF under an interface.

The "targeted" container under a VRF instance allows to configure LDP targeted discovery related parameters. Within this container, the "target" list provides a mean to configure multiple target addresses to perform extended discovery to a specific destination target, as well as to fine-tune the per-target parameters.

5.2.1.5. Per-VRF Peer parameters

This container is used to hold LDP configuration related to LDP sessions and peers under a VRF instance. This container allows to configure parameters that either apply on VRF's all peers or a subset (peer-list) of VRF peers. The example of such parameters include authentication password, session KA timers etc. Moreover, the model also allows per-peer parameter tuning by specifying a "peer" list under the "peers" container. A peer is uniquely identified using its LSR Id and hence LSR Id is the key for peer list

Like per-interface parameters, some per-peer parameters are AF-agnostic (i.e. either non AF related or apply to both IP address families), and some that belong to an AF. The example of former is per-peer session password configuration, whereas the example of latter is prefix-list based label policies (inbound and outbound) that apply to a given peer.

5.2.1.6. Per-VRF Forwarding parameters

This container is used to hold configuration used to control LDP forwarding behavior under a VRF instance. One example of a configuration under this container is when a user wishes to enable neighbor discovery on an interface but wishes to disable use of the same interface as forwarding nexthop. This example configuration makes sense only when there are more than one LDP enabled interfaces towards the neighbor.

6. Operational State

Operational state of LDP can be queried and obtained from read-only state containers that fall under the same tree (/rt:routing/rt:control-plane-protocols/) as the configuration.

6.1. Operational Tree

6.1.1. Base

Following is a simplified graphical representation of the base data model for LDP operational state.

```

Figure 9

6.2. States

Following are main areas for which LDP operational state is defined:

Neighbor Adjacencies

Peer

Bindings (FEC-label and address)

Capabilities

6.2.1. Adjacency state

Neighbor adjacencies are per address-family hello adjacencies that are formed with neighbors as result of LDP basic or extended discovery. In terms of organization, there is a source of discovery (e.g. interface or target address) along with its associated parameters and one or more discovered neighbors along with neighbor discovery related parameters. For the basic discovery, there could be more than one discovered neighbor for a given source (interface), whereas there is at most one discovered neighbor for an extended discovery source (local-address and target-address). This is also to be noted that the reason for a targeted neighbor adjacency could be either an active source (locally configured targeted) or passive source (to allow any incoming extended/targeted hellos). A neighbor/adjacency record also contains session-state that helps highlight whether a given adjacency has progressed to subsequent session level or to eventual peer level.

Following captures high level tree hierarchy for neighbor adjacency state.

```
+--rw mpls-ldp!
  +-+rw discovery
    +-+rw interfaces
      |  +-+rw interface* [interface]
      |  +-+rw address-families
      |  |  +-+rw ipv4 (or ipv6)
      |  |  +-+ro hello-adjacencies
      |  |  |  +-+ro hello-adjacencies* [adjacent-address]
      |  |  |  +-+ro adjacent-address
      |  |  . . .
      |  |  . . .
    +-+rw targeted
      +-+rw address-families
        +-+rw ipv4 (or ipv6)
        +-+ro hello-adjacencies
          +-+ro hello-adjacencies*
            [local-address adjacent-address]
          +-+ro local-address
          +-+ro adjacent-address
        . . .
        . . .
```

Figure 10

6.2.2. Peer state

Peer related state is presented under peers tree. This is one of the core state that provides info on the session related parameters (mode, authentication, KA timeout etc.), TCP connection info, hello adjacencies for the peer, statistics related to messages and bindings, and capabilities exchange info.

Following captures high level tree hierarchy for peer state.

```
+--rw mpls-ldp!
  +-rw peers
    +-rw peer* [lsr-id label-space-id]
      +-rw lsr-id
      +-rw label-space-id
      +-ro label-advertisement-mode
      +-ro session-state
      +-ro tcp-connection
      +-ro session-holdtime?
      +-ro up-time
      +--- . . .
      +-ro address-families
        | +-ro ipv4 (or ipv6)
        |   +-ro hello-adjacencies
        |     +-ro hello-adjacencies*
        |       [local-address adjacent-address]
        |
        |   . . .
        |
        |   . . .
      +-ro received-peer-state
        | +-ro . . .
        | +-ro capability
        |   +-ro . . .
      +-ro statistics
        +- . . .
        +- received
          | +- . . .
        +- sent
          +- . . .
```

Figure 11

6.2.3. Bindings state

Binding state provides information on LDP FEC-label bindings as well as address binding for both inbound (received) as well as outbound (advertised) direction. FEC-label bindings are presented as a FEC-centric view, and address bindings are presented as an address-centric view:

Raza, et al.

Expires December 2, 2019

[Page 33]

FEC-Label bindings:

FEC 203.0.113.1/32:

- advertised: local-label 16000
 - peer 192.0.2.1:0
 - peer 192.0.2.2:0
 - peer 192.0.2.3:0

- received:

- peer 192.0.2.1:0, label 16002, used-in-forwarding=Yes
 - peer 192.0.2.2:0, label 17002, used-in-forwarding>No

FEC 203.0.113.2/32:

- .
- .
- .

FEC 198.51.100.0/24:

- .
- .
- .

Address bindings:

Addr 192.0.2.10:

- advertised

Addr 192.0.2.1:

- received, peer 192.0.2.1:0

Addr 192.0.2.2:

- received, peer 192.0.2.2:0

Addr 192.0.2.3:

- received, peer 192.0.2.3:0

Figure 12

Note that all local addresses are advertised to all peers and hence no need to provide per-peer information for local address advertisement. Furthermore, note that it is easy to derive a peer-centric view for the bindings from the information already provided in this model.

Following captures high level tree hierarchy for bindings state.

```

++-rw mpls-ldp!
  +-rw global
    +-rw address-families
      +-rw ipv4 (or ipv6)
        +-ro bindings
          +-ro address* [address]
          | +-ro address (ipv4-address or ipv6-address)
          | +-ro advertisement-type? advertised-received
          | +-ro peer? leafref
        +-ro fec-label* [fec]
          +-ro fec (ipv4-prefix or ipv6-prefix)
          +-ro peer* [peer advertisement-type]
            +-ro peer leafref
            +-ro advertisement-type? advertised-received
            +-ro label? mpls:mpls-label
            +-ro used-in-forwarding? boolean

```

Figure 13

6.2.4. Capabilities state

LDP capabilities state comprise two types of information - global information (such as timer etc.), and per-peer information.

Following captures high level tree hierarchy for LDP capabilities state.

```

++-rw mpls-ldp!
  +-rw peers
    +-rw peer* [lsr-id label-space-id]
      +-rw lsr-id yang:dotted-quad
      +-rw label-space-id
      +-ro received-peer-state
        +-ro capability
          +-ro . . .
        +-ro . . .

```

Figure 14

7. Notifications

This model defines a list of notifications to inform client of important events detected during the protocol operation. These events include events related to changes in the operational state of an LDP peer, hello adjacency, and FEC etc. It is to be noted that an

LDP FEC is treated as operational (up) as long as it has at least 1 NHLFE with outgoing label.

Following is a simplified graphical representation of the data model for LDP notifications.

```
module: ietf-mpls-ldp
  notifications:
    +---n mpls-ldp-peer-event
      |   +-ro event-type?    oper-status-event-type
      |   +-ro peer
      |     +-ro lsr-id?        leafref
      |     +-ro label-space-id?  leafref
    +---n mpls-ldp-hello-adjacency-event
      |   +-ro event-type?    oper-status-event-type
      |   +-ro (hello-adjacency-type)?
      |     +--:(targeted)
      |       |   +-ro targeted
      |         +-ro target-address?  inet:ip-address
      |     +--:(link)
      |       +-ro link
      |         +-ro next-hop-interface?  if:interface-ref
      |         +-ro next-hop-address?    inet:ip-address
    +---n mpls-ldp-fec-event
      +-ro event-type?    oper-status-event-type
      +-ro prefix?        inet:ip-prefix
```

Figure 15

[8. Actions](#)

This model defines a list of rpcs that allow performing an action or executing a command on the protocol. For example, it allows to clear (reset) LDP peers, hello-adjacencies, and statistics. The model makes an effort to provide different level of control so that a user is able to either clear all, or clear all for a given type, or clear a specific entity.

Following is a simplified graphical representation of the data model for LDP actions.

```

module: ietf-mpls-ldp
rpcs:
  +---x mpls-ldp-clear-peer
  | +---w input
  |   +---w lsr-id?          leafref
  |   +---w label-space-id?  leafref
  +---x mpls-ldp-clear-hello-adjacency
  | +---w input
  |   +---w hello-adjacency
  |     +---w (hello-adjacency-type)?
  |       +---:(targeted)
  |         | +---w targeted!
  |         |   +---w target-address?  inet:ip-address
  |       +---:(link)
  |         +---w link!
  |           +---w next-hop-interface?  leafref
  |           +---w next-hop-address?  inet:ip-address
  +---x mpls-ldp-clear-peer-statistics
    +---w input
      +---w lsr-id?          leafref
      +---w label-space-id?  leafref

```

Figure 18

10. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [[RFC6241](#)] or RESTCONF [[RFC8040](#)]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [[RFC6242](#)]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [[RFC8446](#)].

The Network Configuration Access Control Model (NACM) [[RFC8341](#)] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/ deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes.

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations.

It goes without saying that this specification also inherits the security considerations captured in the actual protocol specification documents, namely base LDP [[RFC5036](#)], LDP IPv6 [[RFC7552](#)], LDP Capabilities [[RFC5561](#)], Typed Wildcard FEC [[RFC5918](#)], LDP End-of-LIB [[RFC5919](#)], and LDP Upstream Label Assignment [[RFC6389](#)].

[11. IANA Considerations](#)

This document requests the registration of the following URIs in the IETF "XML registry" [[RFC3688](#)]:

| URI | Registrant | XML |
|--|------------|-----|
| urn:ietf:params:xml:ns.yang:ietf-mpls-ldp | The IESG | N/A |
| urn:ietf:params:xml:ns.yang:ietf-mpls-ldp-extended | The IESG | N/A |

This document requests the registration of the following YANG modules in the "YANG Module Names" registry [[RFC6020](#)]:

| Name | Namespace | Prefix | Reference |
|------------------------|--|--------------|---------------|
| ietf-mpls-ldp | urn:ietf:params:xml:ns.yang:ietf-mpls-ldp | ldp | This document |
| ietf-mpls-ldp-extended | urn:ietf:params:xml:ns.yang:ietf-mpls-ldp-extended | ldp-extended | This document |

-- RFC Editor: Replace "This document" with the document RFC number at time of publication, and remove this note.

[12. Acknowledgments](#)

The authors would like to acknowledge Eddie Chami, Nagendra Kumar, Mannan Venkatesan, and Pavan Beeraam for their contribution to this document. We also acknowledge Ladislav Lhotka for his useful comments as the YANG Doctor.

The review comments from Tom Petch, as part of WGLC of this document, were very useful. Some of those comments were also applied to some other YANG modules in the Routing area.

Appendix A. Data Tree Example

This section contains an example of an instance data tree in the JSON encoding [[RFC7951](#)], containing both configuration and state data.

The configuration instance data tree for Router 203.0.113.1 in the above figure could be as follows:

```
{  
    "ietf-interfaces:interfaces": {  
        "interface": [  
            {  
                "name": "eth1",  
                "description": "An interface with LDP enabled.",  
                "type": "iana-if-type:ethernetCsmacd",  
                "ietf-ip:ipv6": {  
                    "address": [  
                        {  
                            "ip": "2001:db8:0:1::1",  
                            "prefix-length": 64  
                        }  
                    ],  
                    "forwarding": true  
                }  
            }  
        ]  
    },  
    "ietf-routing:routing": {  
        "router-id": "203.0.113.1",  
        "control-plane-protocols": {  
            "ietf-mpls-ldp:mpls-ldp": {  
                "global": {  
                    "address-families": {  
                        "ietf-mpls-ldp-extended:ipv6": {  
                            "enable": true  
                        }  
                    }  
                },  
                "discovery": {  
                    "interfaces": {  
                        "interface": [  
                            {  
                                "name": "eth1",  
                                "address-families": {  
                                    "ietf-mpls-ldp-extended:ipv6": {  
                                        "enable": true  
                                    }  
                                }  
                            }  
                        ]  
                    }  
                }  
            }  
        }  
    }  
}
```
