Definitions of Managed Objects for the LDP Point-to-Multipoint and Multipoint-to-Multipoint Label Switched Paths
[draft-ietf-mpls-mldp-mib-04](#)

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols. In particular it defines objects for managing multicast LDP point-to-multipoint (P2MP) and multipoint-to-multipoint (MP2MP) Label Switched Paths. The MIB module defined in this document is extension of LDP MIB defined in [RFC3815](#) which supports only for LDP point-to-point LSPs.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on November 7, 2018.

[1. Introduction](#)

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols. In particular it defines objects for managing multicast LDP point-to-multipoint (P2MP) and multipoint-to-multipoint (MP2MP) Label Switched Paths. The MIB module defined in this document is extension of LDP MIB defined in [RFC3815](#) which supports only for LDP point-to-point LSPs.

The [RFC3815](#) describes only unicast Managed objects for the Label distribution protocol. The [RFC6388](#) describes LDP protocol extensions for the point to multipoint and multipoint to multipoint LSPs. The [RFC6826](#) describes multicast LDP inband signalling for P2MP and MP2MP LSPs.

This document defines a MIB module for managing and controlling mLDP P2MP and MP2MP LSPs. It builds on the objects and tables defined in [[RFC3815](#)] for mLDP MIB.

[2. The Internet-Standard Management Framework](#)

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to [section 7 of RFC3410](#).

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, [RFC2578](#) [[RFC2578](#)], STD 58, [RFC2579](#) [[RFC2579](#)] and STD 58, [RFC2580](#) [[RFC2580](#)].

[3. Conventions](#)

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#), [RFC2119](#) [[RFC2119](#)].

4. Overview

This document focusses on the management of following multicast LDP (mLDP) features, which were defined after unicast LDP [[RFC5036](#)].

[RFC6388](#): Label Distribution Protocol Extensions for Point-to-Multipoint and Multipoint-to-Multipoint Label Switched Paths.

[RFC6826](#): Multipoint LDP In-Band Signaling for Point-to-Multipoint and Multipoint-to-Multipoint Label Switched Paths.

[RFC7060](#): Using LDP Multipoint Extensions on Targeted LDP Sessions.

[RFC7431](#): Multicast only Fast Re-Route.

[RFC7715](#): mLDP Node Protection.

For all the above features, the mLDP MIB needs to include the following information:

- Session Capability (P2MP, MP2MP) information: configured capability, negotiated capability.
- mLDP FECs: include opaque information (Generic LSP Identifier, source and group address) and MoFRR enable.
- Primary and backup upstream session when mLDP MoFRR enabled.
- Active and inactive upstream session for make before break.
- mLDP Traffic stats per mLDP Fec: The traffic stats for mLDP fec.
- mLDP Traffic stats per Interface: The mLDP traffic stats per Interface.
- Notifications when mLDP Fec LSP up, down.

5. Future Considerations

Any new opaque TLVs added for any other mLDP features, the opaque value object in the mplsMldpFecTable need to be enhanced accordingly.

6. Structure of the MIB Module

This section describes the structure of the mLDP MIB. In this MIB MPLS-MLDP-STD-MIB, scalar objects, table objects and notifications are defined. Following section describes in details about each object.

6.1. Summary of mLDP Scalar Objects

New scalar objects `mplsMldpP2mpCapable` and `mplsMldpMp2mpCapable` are defined to provide the mLDP capabilities of P2MP, MP2MP support.

New scalar objects `mplsMldpMbbCapable` and `mplsMldpMbbTime` are defined to provide MBB capability information.

New scalar object `mplsMldpNumFecs` which will give the total number of mLDP FECs setup on the LSR.

Another New scalar object `mplsMldpNumFecsActive`, which will give the total number of active mLDP FECs.

New scalar objects `mplsMldpPlrCapable`, `mplsMldpMptCapable`, `mplsMldpProtLsrCapable` and `mplsMldpNodeProtCapable` are defined to provide mLDP node protection capabilities.

6.2. Summary of mLDP Table Objects

`mplsLdpPeerCapabilityTable` to include peer capability information.

`mplsMldpSessionStatsTable` : This table contains the number of mLDP FECs received and advertised to a particular LDP session.

`mplsMldpFecTable`: This table is similar to point to point `mplsLdpFecTable` and will have mLDP specific Fec information.

`mplsMldpFecBranchStatsTable` : This table contains the traffic statistics for the given mLDP FECs on particular interface.

`mplsMldpFecUpstreamSessTable` : Includes the upstream session info for the particular mLDP Fec and also includes the primary or backup upstream session, that may be used for mLDP MoFRR.

`mplsMldpInterfaceStatsTable` : This table contains the traffic statistics for all mLDP related FECs.

7. mLDP Scalar Objects

The following scalars are defined in this MIB Module.

7.1. `mplsMldpP2mpCapable`

The `mplsMldpP2mpCapable` scalar object denotes whether the LSR is capable of supporting multicast LDP with Point-to-Multipoint capability.

[7.2. mplsMldpMp2mpCapable](#)

The mplsMldpMp2mpCapable scalar object denotes whether the LSR is capable of supporting multicast LDP with Multipoint-to-Multipoint LSPs.

[7.3. mplsMldpMbbCapable](#)

The mplsMldpMbbCapable scalar object denotes whether the LSR is capable of supporting multicast LDP with MBB (make before break) feature mentioned in the [section 8 of RFC 6388](#).

[7.4. mplsMldpMbbTime](#)

The mplsMldpMbbTime scalar object denotes MBB time for which LSR is waiting for MBB Ack from upstream node. This timer helps LSR to prevent waiting indefinitely for the MBB Notification from upstream node.

[7.5. mplsMldpNumFecs](#)

The mplsMldpNumFecs provides a read-only counter of the number of mLDP FECs setup on this LSR.

[7.6. mplsMldpNumFecsActive](#)

The mplsMldpNumFecsActive provides a read-only counter of the number of mLDP FECs Active on this LSR.

[7.7. mplsMldpPlrCapable](#)

The mplsMldpPlrCapable scalar object denotes whether the LSR is capable of supporting PLR capability as specified in the [section 5.1 of RFC7715](#).

[7.8. mplsMldpMptCapable](#)

The mplsMldpMptCapable scalar object denotes whether the LSR is capable of supporting MPT capability as specified in the [section 5.2 of RFC7715](#).

[7.9. mplsMldpProtLsrCapable](#)

The mplsMldpProtLsrCapable scalar object denotes whether the LSR is capable of supporting the "Protected LSR" capability as specified in the [section 5.3 of RFC7715](#).

7.10. mplsMldpNodeProtCapable

The `mplsMldpNodeProtCapable` scalar object denotes whether the LSR is capable of supporting the "Node Protection" capability as specified in the [section 5.4 of RFC7715](#).

8. mLDP Table Objects

8.1. LDP Peer Capability Table `mplsLdpPeerCapabilityTable`

The new table `mplsLdpPeerCapabilityTable` is read-only table, which contains learned capability information from an LDP peer. This table augments the `mplsLdpPeerTable`, which is defined in [RFC 3815](#). This is defined in this MIB as it is not defined in the standard LDP MIB ([RFC3815](#)) .

8.2. mLDP Session Stats Table: `mplsMldpSessionStatsTable`

The `mplsMldpSessionStatsTable` is a read-only table which contains mLDP statistical information on sessions. This table augments the `mplsLdpSessionStatsTable`, which is defined in the [RFC 3815](#).

8.3. mLDP Fec Table: `mplsMldpFecTable`

The `mplsMldpFecTable` is a table which contains FEC (Forwarding Equivalence Class) information relating to point to multi-point and multipoint to multipoint LDP LSP. Each entry/row represents a single FEC Element. This table is similar LDP FEC Table, `mplsLdpLspFecTable`, which is defined in the [RFC 3815](#), which associates FECs with the LSPs.

8.4. mLDP Fec Branch Traffic statistics Table: `mplsMldpFecBranchStatsTable`

This table `mplsMldpFecBranchStatsTable` gives information about the number of packets and number of bytes sent out on particualr downstream session or on outgoing interface.

8.5. mLDP Fec Upstream Session Table: `mplsMldpFecUpstreamSessTable`

The `mplsMldpFecUpstreamSessTable` is a read-only table which contains mLDP upstream session information for mLDP Fec. This table is similar to `mplsInSegmentLdpLspTable`. This table will also have information about primary, backup upstream session, and also indicates whether the label is in MBB request or MBB Ack received state.

8.6. mLDP Interface Traffic statistics Table: mplsMldpInterfaceStatsTable

This table mplsMldpInterfaceStatsTable gives information about the number of mLDP packets and number of mLDP bytes sent and received on a particular interface for all mLDP FECs.

9. The mLDP Notifications

The [RFC 3815](#) defined some of the notifications related to session and P2P Fec. In this MIB, the following notification added to support mLDP features.

The mplsMldpFecUp and mplsMldpFecDown notifications are generated when mLDP FEC changes the state to UP and Down.

The mplsMldpMoFrrStatusChange notification is generated when mLDP MoFRR status switches from primary to backup path and vice versa.

10. Relationship to Other MIB Modules

This section describes relationships between MIB tables defined in this document as part of MPLS-MLDP-STD-MIB, and the tables defined in MPLS-LDP-STD-MIB [[RFC3815](#)] and MPLS-LSR-STD-MIB [[RFC3813](#)].

The Figure 1 shows the diagrammatic representation of the relationship between MPLS-MLDP-STD-MIB, MPLS-LDP-STD-MIB and MPLS-LSR-STD-MIB. An arrow in the Figure shows that the MIB table pointed from contains a reference to the MIB table pointed to.

10.1. Diagrammatic Representation

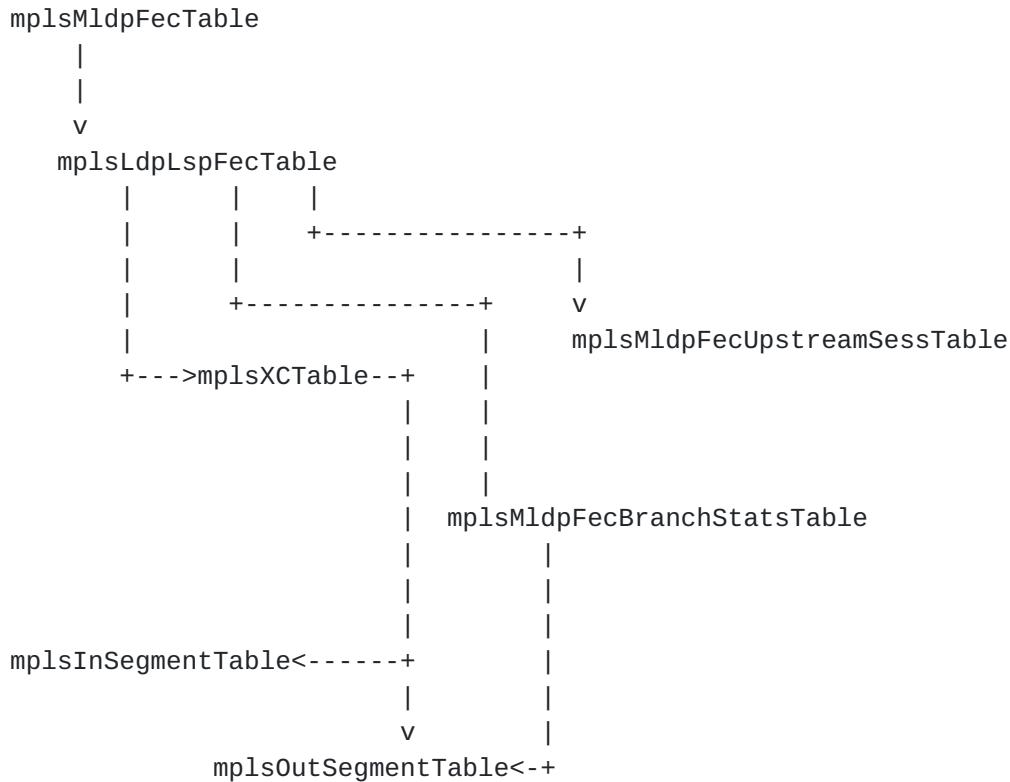

Figure 1 : Dependencies Between MIB Tables

Figure 1

10.2. Relationship to the LSR MIB

The LSR MIB [[RFC3813](#)] have below tables, which cross connects the incoming label to outgoing label. Below Tables will be used for mLDP also in the similar way as in the point to point LDP LSPs.

```

mplsXCTable

mplsInSegmentTable

mplsOutSegmentTable
  
```

10.3. Relationship to the LDP MIB

The MIB module defined in this document is extension of MPLS-LDP-STD-MIB to support multicast LDP features.

Below optional tables in MPLS-LDP-STD-MIB, will also be used in mLDP for associating the mLDP LSPs to LSR-MIB tables.

```
mplsLdpLspFecTable  
mplsInSegmentLdpLspTable  
mplsOutSegmentLdpLspTable
```

12. Security Considerations

This MIB module is useful for the configuration of certain objects and monitoring of mLDP LSPs.

There are no management objects defined in this MIB module that have a MAX-ACCESS clause of read-write and/or read-create. So, if this MIB module is implemented correctly, then there is no risk that an intruder can alter or create any management objects of this MIB module via direct SNMP SET operations.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to

control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

- o mplsMldpFecTable
- o mplsLdpPeerCapabilityTable
- o mplsMldpSessionStatsTable
- o mplsMldpFecBranchStatsTable
- o mplsMldpFecUpstreamSessTable
- o mplsMldpInterfaceStatsTable
- o mplsMldpNumFecs
- o mplsMldpNumFecsActive
- o mplsMldpMbbTime

Above listed tables and objects show information about the mLDP LSPs, its route through the network, and its traffic statistics. Knowledge of this information could be used to compromise the network, or simply to breach confidentiality. If an Administrator does not want to reveal this information, these tables and objects should be considered sensitive/vulnerable.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

Implementations SHOULD provide the security features described by the SNMPv3 framework (see [[RFC3410](#)]), and implementations claiming compliance to the SNMPv3 standard MUST include full support for authentication and privacy via the User-based Security Model (USM) [[RFC3414](#)] with the AES cipher algorithm [[RFC3826](#)]. Implementations MAY also provide support for the Transport Security Model (TSM) [[RFC5591](#)] in combination with a secure transport such as SSH [[RFC5592](#)] or TLS/DTLS [[RFC6353](#)].

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator

responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

13. IANA Considerations

This is new MPLS MIB module, contained in this document and IANA is requested to assign an oid (mplsStdMIB YYY) under the mplsStdMIB subtree to the MPLS-MLDP-STD-MIB module specified in this document.

14. Acknowledgments

The authors wish to thank Santosh Esale, Alia Atlas and Martin Ehlers for doing the detailed review. Thanks to Adrian Farrel and Raveendra Torvi for their input to this work and for many helpful suggestions.
