A YANG Data Model for MPLS Static LSPs
draft-ietf-mpls-static-yang-01

Abstract

This document contains the specification for the MPLS Static Label Switched Paths (LSPs) YANG model. The model allows for the provisioning of static LSP(s) on LER(s) and LSR(s) devices along a LSP path without the dependency on any signaling protocol. The MPLS Static LSP model augments the MPLS base YANG model with specific data to configure and manage MPLS Static LSP(s).

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 6, 2017.

[1.](#) Introduction

This document describes a YANG data model for configuring and managing the Static LSPs feature. The model allows the configuration of LER and LSR devices with the necessary MPLS cross-connects or bindings to realize an end-to-end LSP service.

A static LSP is established by manually specifying incoming and outgoing MPLS label(s) and necessary forwarding information on each of the traversed Label Edge Router (LER) and Label Switched Router (LSR) devices (ingress, transit, or egress nodes) of the forwarding path.

For example, on an ingress LER device, the model is used to associate

a specific Forwarding Equivalence Class (FEC) of packets- e.g. matching a specific IP prefix in a Virtual Routing or Forwarding (VRF) instance- to an MPLS outgoing label imposition, next-hop(s) and respective outgoing interface(s) to forward the packet. On an LSR device, the model is used to create a binding that swaps the incoming

label with an outgoing label and forwards the packet on one or multiple egress path(s). On an egress LER, it is used to create a binding that decapsulates the incoming MPLS label and performs forwarding based on the inner MPLS label (if present) or IP forwarding in the packet.

The MPLS Static LSP YANG model is defined in module "ietf-mpls-static" and augments the MPLS Base YANG model defined in module "ietf-mpls" in [[I-D.saad-mpls-static-yang](#)]. The approach described in [[I-D.openconfig-netmod-opstate](#)] is adopted to represent data pertaining to configuration intended, applied state and derived state data elements. Each container in the model holds a "config" and "state" sub-container. The "config" sub-container is used to represent the intended configurable parameters, and the state sub-container is used to represent both the applied configurable parameters and any derived state, such as counters or statistical information.

[1.1](#). Terminology

In this document, the key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" are to be interpreted as described in [BCP 14](#), [RFC 2119](#) [[RFC2119](#)].

The following terms are defined in [[RFC6020](#)]:

- o augment,
- o configuration data,
- o data model,
- o data node,
- o feature,

- o mandatory node,
- o module,
- o schema tree,
- o state data,
- o RPC operation.

[1.2.](#) Model Organization

The base MPLS Static LSP model covers the core features with the minimal set of configuration parameters needed to manage and operate MPLS Static LSPs.

Additional MPLS Static LSP parameters as well as optional feature(s) are grouped in a separate MPLS Static LSP extended model. The relationship between the MPLS base and other MPLS modules are shown in Figure 1.

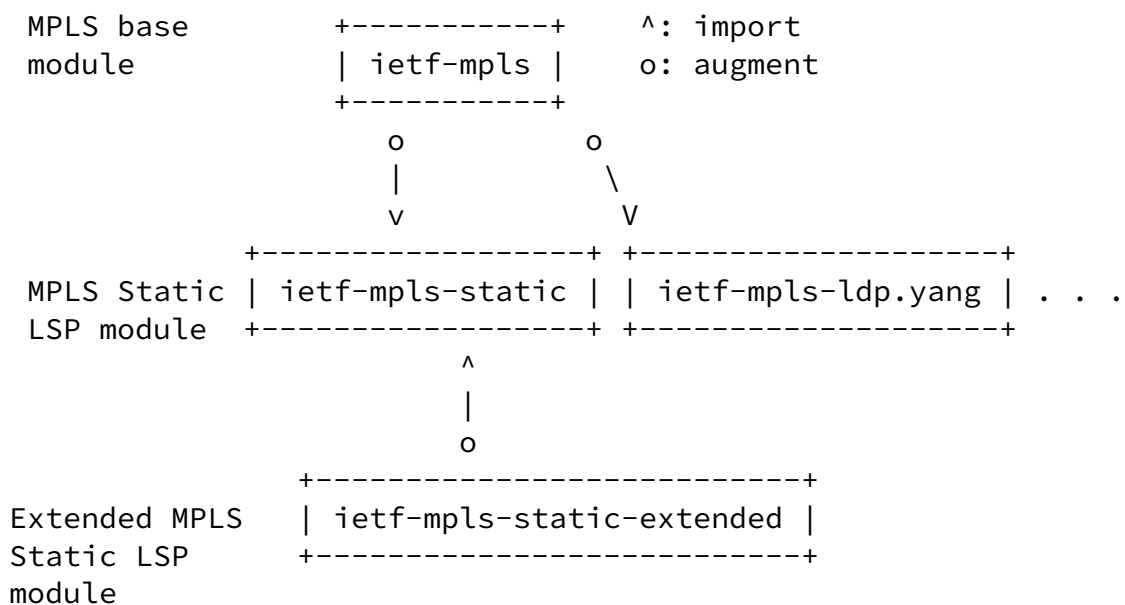

Figure 1: Relationship between MPLS modules

1.3. MPLS Static LSPs Model Tree Diagram

The MPLS Static LSP tree diagram is shown in Figure 2.

Figure 4: Extended MPLS Static LSP YANG module

2. IANA Considerations

This document registers the following URIs in the IETF XML registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration is requested to be made.

URI: urn:ietf:params:xml:ns:yang:ietf-mpls-static XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-mpls-static-extended XML: N/A, the requested URI is an XML namespace.

This document registers two YANG modules in the YANG Module Names registry [[RFC6020](#)].

name: ietf-mpls-static namespace: urn:ietf:params:xml:ns:yang:ietf-mpls-static prefix: ietf-mpls-static reference: [RFC3031](#)

name: ietf-mpls-static-extended namespace:
urn:ietf:params:xml:ns:yang:ietf-mpls-static-extended prefix: ietf-
mpls-static reference: [RFC3031](#)

3. Security Considerations

The YANG module defined in this memo is designed to be accessed via the NETCONF protocol [[RFC6241](#)]. The lowest NETCONF layer is the secure transport layer and the mandatory-to-implement secure transport is SSH [[RFC6242](#)]. The NETCONF access control model [[RFC6536](#)] provides means to restrict access for particular NETCONF users to a pre-configured subset of all available NETCONF protocol operations and content.

There are a number of data nodes defined in the YANG module which are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., <edit-config>) to these data nodes without proper protection can have a negative effect on network operations.
