MPLS-TP Operations, Administration, and Management (OAM) Identifiers Management Information Base (MIB) draft-ietf-mpls-tp-oam-id-mib-03

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes Operations, Administration, and Management (OAM) identifiers related managed objects for Multiprotocol Label Switching (MPLS) based Transport Profile (TP).

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt.

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

This Internet-Draft will expire on December 20, 2013.

Table of Contents

1 Introduction

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects for modeling a Multiprotocol Label Switching (MPLS) [RFC3031] based transport profile.

This MIB module should be used for performing the OAM operations for MPLS LSPs, Pseudowires and Sections.

2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC2578, STD 58, RFC2579 and STD58, RFC2580.

3. Overview

3.1 Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC-2119 [RFC2119].

3.2 Terminology

This document uses terminology from the Multiprotocol Label Switching Architecture [RFC3031], Multiprotocol Label Switching (MPLS) Traffic Engineering (TE)Management Information Base (MIB)[RFC3812], Multiprotocol Label Switching (MPLS) Label Switching Router (LSR) Management Information Base (MIB)[RFC3813], Operations, Administration, and Maintenance Framework for MPLS-Based Transport Networks [RFC6371], MPLS Transport Profile (MPLS-TP) Identifiers [RFC6370], MPLS-TP Identifiers Following ITU-T Conventions [RFC6923], and OAM in MPLS Transport Networks [RFC5860].

3.3 Acronyms

ICC: ITU Carrier Code
IP: Internet Protocol

LSP: Label Switching Path
LSR: Label Switching Router
MIB: Management Information Base
ME: Maintenance Entity
MEG: Maintenance Entity Group
MEP: Maintenance Entity Group End Point
MIP: Maintenance Entity Group Intermediate Point
MPLS: Multi-Protocol Label Switching
MPLS-TP: MPLS Transport Profile
PW: Pseudowire
TE: Traffic Engineering
TP: Transport Profile

4. Feature List

The MPLS transport profile OAM identifiers MIB module is designed to satisfy the following requirements and constraints:

- The MIB module supports configuration of OAM identifiers for point-to-point, co-routed bidirectional, associated bidirectional MPLS tunnels and MPLS Pseudowires.

5. Brief description of MIB Objects

The objects described in this section support the functionality described in documents [RFC5654] and [RFC6370]. The tables support both IP compatible and ICC based OAM identifiers configurations for MPLS Tunnels and Pseudowires.

5.1. mplsOamIdMegTable

The mplsOamIdMegTable is used to manage one or more Maintenance Entities (MEs) that belongs to the same transport path.

When a new entry is created with mplsOamIdMegOperatorType set to ipCompatible (1), then as per [RFC6370] (MEG_ID for LSP is LSP_ID and MEG_ID for PW is PW_Path_ID), MEP_ID can be automatically formed.

For ICC based transport path, the user is expected to configure the ICC identifier explicitly in this table for MPLS tunnels and pseudowires.

5.2. mplsOamIdMeTable

The mplsOamIdMeTable defines a relationship between two points (source and sink) of a transport path to which maintenance and monitoring operations apply. The two points that define a maintenance entity are called Maintenance Entity Group End Points (MEPs).

In between MEPs, there are zero or more intermediate points, called Maintenance Entity Group Intermediate Points (MIPs). MEPs and MIPs are associated with the MEG and can be shared by more than one ME in a MEG.

6. MPLS OAM identifier configuration for MPLS tunnel example

In this section, we provide an example of the OAM identifier configuration for an MPLS co-routed bidirectional tunnel.

This example provides usage of a MEG and ME tables for management and monitoring operations of an MPLS tunnel.

This example considers the OAM identifiers configuration on a head-end LSR to manage and monitor a MPLS tunnel.
Only relevant objects which are applicable for IP based OAM identifiers of co-routed MPLS tunnel are illustrated here.

In mplsOamIdMegTable:

```
{
  -- MEG index (Index to the table)
  mplsOamIdMegIndex                = 1,
  mplsOamIdMegName                 = "MEG1",
  mplsOamIdMegOperatorType         = ipCompatible (1),
  mplsOamIdMegServicePointerType   = lsp (1),
  mplsOamIdMegMpLocation           = perNode(1),
-- Mandatory parameters needed to activate the row go here
  mplsOamIdMegRowStatus            = createAndGo (4),
  mplsOamIdMegPathFlow
                       = coRoutedBidirectionalPointToPoint (2)
}
```

This will create an entry in the mplsOamIdMegTable to manage and monitor the MPLS tunnel.

The following ME table is used to associate the path information to a MEG.

```
In mplsOamIdMeTable:

{
-- ME index (Index to the table)
 mplsOamIdMeIndex                  = 1,

-- MP index (Index to the table)
 mplsOamIdMeMpIndex                = 1,
 mplsOamIdMeName                   = "ME1",
 mplsOamIdMeMpIfIndex              = 0,
 -- Source MEP id is derived from the IP compatible MPLS tunnel
 mplsOamIdMeSourceMepIndex         = 0,
 -- Source MEP id is derived from the IP compatible MPLS tunnel
 mplsOamIdMeSinkMepIndex           = 0,
 mplsOamIdMeMpType                 = mep (1),
 mplsOamIdMeMepDirection           = down (2),
 mplsOamIdMeProactiveOamPhbTCValue = 0,
 mplsOamIdMeOnDemandOamPhbTCValue  = 0,
--  RowPointer MUST point to the first accessible column of an
--  MPLS tunnel
 mplsOamIdMeServicePointer         = mplsTunnelName.1.1.10.20,
-- Mandatory parameters needed to activate the row go here
 mplsOamIdMeRowStatus              = createAndGo (4)
}
```

7. MPLS OAM Identifiers MIB definitions

```
MPLS-OAM-ID-STD-MIB DEFINITIONS ::= BEGIN

               "This table contains information about the Maintenance
                Entity Groups (MEG).

                MEG as mentioned in MPLS-TP OAM framework defines a set
                of one or more maintenance entities (ME).
                Maintenance Entities define a relationship between any
                two points of a transport path in an OAM domain to which
                maintenance and monitoring operations apply."
         ::= { mplsOamIdObjects 2 }

        mplsOamIdMegEntry OBJECT-TYPE
         SYNTAX        MplsOamIdMegEntry
         MAX-ACCESS    not-accessible
         STATUS        current
         DESCRIPTION
               "An entry in this table represents MPLS-TP MEG.
                An entry can be created by a network administrator
                or by an SNMP agent as instructed by an MPLS-TP OAM
                Framework.

                When a new entry is created with
                mplsOamIdMegOperatorType set to ipCompatible (1),
                then as per [RFC6370] (MEG_ID for LSP is LSP_ID and
                MEG_ID for PW is PW_Path_ID), MEP_ID can be
                automatically formed.

                For co-routed bidirectional LSP, MEG_ID is
                A1-{Global_ID::Node_ID::Tunnel_Num}::Z9-{Global_ID::
                Node_ID::Tunnel_Num}::LSP_Num.

                For associated bidirectional LSP, MEG_ID is A1-
                {Global_ID::Node_ID::Tunnel_Num::LSP_Num}:: Z9-
                {Global_ID::Node_ID::Tunnel_Num::LSP_Num}

                For LSP, MEP_ID is formed using,
```

```
            Global_ID::Node_ID::Tunnel_Num::LSP_Num

            For PW, MEG_ID is formed using AGI::A1-
            {Global_ID::Node_ID::AC_ID}:: Z9-
            {Global_ID::Node_ID::AC_ID}.

            For PW, MEP_ID is formed using
            AGI::Global_ID::Node_ID::AC_ID

            MEP_ID is retrieved from the mplsOamIdMegServicePointer
            object based on the mplsOamIdMegServicePointerType value.
            ICC MEG_ID for LSP and PW is formed using the objects
            mplsOamIdMegIdIcc and mplsOamIdMegIdUmc.

            MEP_ID can be formed using MEG_ID::MEP_Index."

              "This table contains MPLS-TP maintenance entity
               information.

               ME is some portion of a transport path that requires
               management bounded by two points (called MEPs), and the
               relationship between those points to which maintenance
               and monitoring operations apply.

               This table is generic enough to handle MEPs and MIPs
               information within a MEG."
        ::= { mplsOamIdObjects 5 }

       mplsOamIdMeEntry OBJECT-TYPE
        SYNTAX       MplsOamIdMeEntry
        MAX-ACCESS   not-accessible STATUS       current
        DESCRIPTION
             "An entry in this table represents MPLS-TP maintenance
              entity. This entry represents the ME if the source and
              sink MEPs are defined.

              A ME is a p2p entity. One ME has two such MEPs.
              A MEG is a group of one or more MEs. One MEG can have
              two or more MEPs.

              For P2P LSP, one MEG has one ME and this ME is associated
              two MEPs (source and sink MEPs) within a MEG.
              Each mplsOamIdMeIndex value denotes the ME within a MEG.

              In case of unidirectional point-to-point transport paths,
              a single unidirectional Maintenance Entity is defined to
              monitor it and mplsOamIdMeServicePointer points to
              unidirectional point-to-point path.

              In case of associated bidirectional point-to-point
              transport paths, two independent unidirectional
              Maintenance Entities are defined to independently monitor
              each direction and each mplsOamIdMeServicePointer MIB
              object points to unique unidirectional transport path.
              This has implications for transactions that terminate at
              or query a MIP, as a return path from MIP to source MEP
              does not necessarily exist within the MEG.

              In case of co-routed bidirectional point-to-point
              transport paths, a single bidirectional Maintenance Entity
              is defined to monitor both directions congruently and
              mplsOamIdMeServicePointer MIB object points to co-routed
```

```
            bidirectional point-to-point transport path.

            In case of unidirectional point-to-multipoint transport
            paths, a single unidirectional Maintenance entity for each
            leaf is defined to monitor the transport path from the
            root to that leaf and each leaf has different transport
            path information in mplsOamIdMeServicePointer MIB object.
            Note that the MplsOamIdMeEntry should be created manually
            once the MEG is configured for OAM operations."

8. Security Consideration

There is a number of management objects defined in this MIB module that has a MAX-ACCESS clause of read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full supports for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principles (users) that have legitimate

rights to indeed GET or SET (change/create/delete) them.

9. IANA Considerations

IANA is requested to assign an OID for the MIB module from the "MIB Transmission Group - MPLS STD" sub-registry of the "Internet-standard MIB - Transmission Group" registry for the MPLS-TP OAM ID MIB module specified in this document.
