**MPLS-TP Operations, Administration, and Management (OAM) Identifiers
Management Information Base (MIB)
draft-ietf-mpls-tp-oam-id-mib-10**

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects to configure the Operations, Administration, and Management (OAM) identifiers for Multiprotocol Label Switching (MPLS) and MPLS-based Transport Profile (TP).

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on March 11, 2016.

1 Introduction

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects for modeling a Multiprotocol Label Switching- (MPLS) [[RFC3031](#)] based transport profile.

This MIB module should be used for performing the OAM (Operations, Administration, and Maintenance) operations for MPLS Tunnel LSP (Label Switched Path), Pseudowires, and Sections.

At the time of writing, SNMP SET is no longer recommended as a way to configure MPLS networks as was described in [[RFC3812](#)]. However, since the MIB modules specified in this document are intended to work in parallel with the MIB modules for MPLS specified in [[RFC3812](#)], certain objects defined here are specified with MAX-ACCESS of read-write or read-create so that specifications of the base tables in [[RFC3812](#)] and the new MIB modules in this document are consistent. Although the examples described in [Section 6](#) specify means to configure OAM identifiers for MPLS-TP tunnels, this should be seen as indicating how the MIB values would be returned in the specified circumstances having been configured by alternative means.

2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to [section 7 of RFC3410](#) [[RFC3410](#)].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant with the SMIV2, which is described in STD 58([RFC2578](#), [RFC2579](#), [RFC2580](#)).

3. Overview

3.1 Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

3.2 Terminology

This document uses terminology from the Multiprotocol Label Switching Architecture [[RFC3031](#)], MPLS Traffic Engineering (TE) MIB [[RFC3812](#)], MPLS Label Switching Router (LSR) MIB [[RFC3813](#)], OAM Framework for MPLS-Based Transport Networks [[RFC6371](#)], MPLS Transport Profile (MPLS-TP) Identifiers [[RFC6370](#)], MPLS-TP Identifiers Following ITU-T Conventions [[RFC6923](#)], and OAM in MPLS Transport Networks [[RFC5860](#)].

3.3 Acronyms

BFD: Bidirectional Forwarding Detection
ICC: ITU Carrier Code
IP: Internet Protocol
LSP: Label Switched Path
LSR: Label Switching Router
MIB: Management Information Base
ME: Maintenance Entity
MEG: Maintenance Entity Group
MEP: Maintenance Entity Group End Point
MIP: Maintenance Entity Group Intermediate Point
MPLS: Multi-Protocol Label Switching
MPLS-TP: MPLS Transport Profile
PW: Pseudowire
TE: Traffic Engineering
TP: Transport Profile

4. Feature List

The MPLS transport profile OAM identifiers MIB module is designed to satisfy the following requirements and constraints:

- The MIB module supports configuration of OAM identifiers for MPLS point-to-point Tunnels, point-to-multipoint LSPs, co-routed bidirectional LSPs, associated bidirectional LSPs, and Pseudowires.

5. Brief description of MIB Objects

The objects described in this section support the functionality described in documents [[RFC5654](#)] and [[RFC6370](#)]. The tables support both IP-compatible and ICC-based OAM identifiers configurations for MPLS Tunnels, LSPs, and Pseudowires.

5.1. mplsOamIdMegTable

The mplsOamIdMegTable is used to manage one or more Maintenance Entities (MEs) that belong to the same transport path.

When a new entry is created with `mplsOamIdMegOperatorType` set to `ipCompatible (1)`, then as per [RFC6370] (`MEG_ID` for LSP is `LSP_ID` and `MEG_ID` for PW is `PW_Path_ID`), `MEP_ID` can be automatically formed.

For ICC-based transport path, the user is expected to configure the ICC identifier explicitly in this table for MPLS Tunnels, LSPs, and Pseudowires.

5.2. mplsOamIdMeTable

The `mplsOamIdMeTable` defines a relationship between two points (source and sink) of a transport path to which maintenance and monitoring operations apply. The two points that define a maintenance entity are called Maintenance Entity Group End Points (MEPs).

In between MEPs, there are zero or more intermediate points, called Maintenance Entity Group Intermediate Points (MIPs). MEPs and MIPs are associated with the MEG and can be shared by more than one ME in a MEG.

6. MPLS OAM identifier configuration for MPLS LSP example

In this section, we provide an example of the OAM identifier configuration for an MPLS co-routed bidirectional LSP.

This example provides usage of MEG and ME tables for management and monitoring operations of an MPLS LSP.

This example considers the OAM identifiers configuration on a head-end LSR to manage and monitor an MPLS LSP. Only relevant objects which are applicable for IP-based OAM identifiers of MPLS co-routed bidirectional LSP are illustrated here.

In `mplsOamIdMegTable`:

```
{
  -- MEG index (Index to the table)
  mplsOamIdMegIndex          = 1,
  mplsOamIdMegName           = "MEG1",
  mplsOamIdMegOperatorType   = ipCompatible (1),
  mplsOamIdMegServicePointerType = lsp (1),
  mplsOamIdMegMpLocation     = perNode(1),
  -- Mandatory parameters needed to activate the row go here
```

```

    mplsOamIdMegRowStatus          = createAndGo (4),
    mplsOamIdMegPathFlow
                                   = coRoutedBidirectionalPointToPoint (2)
}

```

This will create an entry in the mplsOamIdMegTable to manage and monitor the MPLS tunnel.

The following ME table is used to associate the path information to a MEG.

In mplsOamIdMeTable:

```

{
-- ME index (Index to the table)
  mplsOamIdMeIndex                = 1,

-- MP index (Index to the table)
  mplsOamIdMeMpIndex              = 1,
  mplsOamIdMeName                  = "ME1",
  mplsOamIdMeMpIfIndex             = 0,
  -- Source MEP id is derived from the IP-compatible MPLS LSP
  mplsOamIdMeSourceMepIndex        = 0,
  -- Sink MEP id is derived from the IP-compatible MPLS LSP
  mplsOamIdMeSinkMepIndex          = 0,
  mplsOamIdMeMpType                 = mep (1),
  mplsOamIdMeMepDirection          = down (2),
  -- RowPointer MUST point to the first accessible column of an
  -- MPLS LSP
  mplsOamIdMeServicePointer        = mplsTunnelName.1.1.10.20,
  -- Mandatory parameters needed to activate the row go here
  mplsOamIdMeRowStatus              = createAndGo (4)
}

```

7. MPLS OAM Identifiers MIB definitions

MEG as mentioned in MPLS-TP OAM framework defines a set of one or more maintenance entities (ME).

Maintenance Entities define a relationship between any two points of a transport path in an OAM domain to which maintenance and monitoring operations apply."

::= { mplsOamIdObjects 2 }

mplsOamIdMegEntry OBJECT-TYPE

SYNTAX MplsOamIdMegEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"An entry in this table represents MPLS-TP MEG.

An entry can be created by a network administrator or by an SNMP agent as instructed by an MPLS-TP OAM Framework.

When a new entry is created with mplsOamIdMegOperatorType set to ipCompatible (1), then as per [[RFC6370](#)] (MEG_ID for LSP is LSP_ID and MEG_ID for PW is PW_Path_ID), MEP_ID can be automatically formed.

For co-routed bidirectional LSP, MEG_ID is A1-{Global_ID::Node_ID::Tunnel_Num}::Z9-{Global_ID::Node_ID::Tunnel_Num}::LSP_Num.

For associated bidirectional LSP, MEG_ID is A1-{Global_ID::Node_ID::Tunnel_Num::LSP_Num}::Z9-{Global_ID::Node_ID::Tunnel_Num::LSP_Num}

For LSP, MEP_ID is formed using, Global_ID::Node_ID::Tunnel_Num::LSP_Num

For PW, MEG_ID is formed using AGI::A1-{Global_ID::Node_ID::AC_ID}::Z9-{Global_ID::Node_ID::AC_ID}.

For PW, MEP_ID is formed using AGI::Global_ID::Node_ID::AC_ID

MEP_ID is retrieved from the mplsOamIdMegServicePointer

object based on the mplsOamIdMegServicePointerType value.
 ICC MEG_ID for LSP and PW is formed using the objects
 mplsOamIdMegIdIcc and mplsOamIdMegIdUmc.

MEP_ID can be formed using MEG_ID::MEP_Index."

"This table contains MPLS-TP maintenance entity information.

ME is some portion of a transport path that requires management bounded by two points (called MEPs), and the

relationship between those points to which maintenance and monitoring operations apply.

This table is generic enough to handle MEPs and MIPs information within a MEG."

::= { mplsOamIdObjects 5 }

mplsOamIdMeEntry OBJECT-TYPE

SYNTAX MplsOamIdMeEntry

MAX-ACCESS not-accessible STATUS current

DESCRIPTION

"An entry in this table represents MPLS-TP maintenance entity. This entry represents the ME if the source and sink MEPs are defined.

A ME is a point-to-point entity. One ME has two such MEPs. A MEG is a group of one or more MEs. One MEG can have two or more MEPs.

For point-to-point LSP, one MEG has one ME and this ME is associated two MEPs (source and sink MEPs) within a MEG. Each mplsOamIdMeIndex value denotes the ME within a MEG.

In case of unidirectional point-to-point transport paths, a single unidirectional Maintenance Entity is defined to monitor it and mplsOamIdMeServicePointer points to unidirectional point-to-point path.

In case of associated bidirectional point-to-point transport paths, two independent unidirectional Maintenance Entities are defined to independently monitor each direction and each mplsOamIdMeServicePointer MIB object points to unique unidirectional transport path. This has implications for transactions that terminate at or query a MIP, as a return path from MIP to source MEP does not necessarily exist within the MEG.

In case of co-routed bidirectional point-to-point transport paths, a single bidirectional Maintenance Entity is defined to monitor both directions congruently and mplsOamIdMeServicePointer MIB object points to co-routed bidirectional point-to-point transport path.

In case of unidirectional point-to-multipoint transport paths, a single unidirectional Maintenance entity for each leaf is defined to monitor the transport path from the root to that leaf and each leaf has different transport

path information in mplsOamIdMeServicePointer MIB object.
 Note that the MplsOamIdMeEntry should be created manually
 once the MEG is configured for OAM operations."

8. Security Consideration

This MIB relates to a system that will provide network connectivity and packet forwarding services. As such, improper manipulation of the objects represented by this MIB may result in denial of service to a large number of end-users.

There are number of management objects defined in this MIB module with a MAX-ACCESS clause of read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection opens devices to attack.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments.

It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

- mplsOamIdMegTable and mplsOamIdMeTable collectively show the MPLS OAM characteristics. If an Administrator does not want to reveal this information, then these tables should be considered sensitive/vulnerable.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

Implementations SHOULD provide the security features described by the

SNMPv3 framework (see [[RFC3410](#)]), and implementations claiming compliance to the SNMPv3 standard MUST include full support for authentication and privacy via the User-based Security Model (USM) [[RFC3414](#)] with the AES cipher algorithm [[RFC3826](#)]. Implementations MAY also provide support for the Transport Security Model (TSM) [[RFC5591](#)] in combination with a secure transport such as SSH [[RFC5592](#)] or TLS/DTLS [[RFC6353](#)].

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

9. IANA Considerations

IANA is requested to assign an OID for the MIB module from the "MIB Transmission Group - MPLS STD" sub-registry of the "Internet-standard MIB - Transmission Group" registry for the MPLS-TP OAM ID MIB module specified in this document.
