Adaptive Subscription to YANG Notification

Abstract

This document defines a YANG data model and associated mechanism enabling the subscriber's adaptive subscriptions to a publisher's event streams with various different period intervals to report updates. Applying these elements allows servers automatically adjust the rate and volume of telemetry traffic sent from a publisher to receivers.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 24 December 2022.

1. Introduction

YANG-Push subscriptions [RFC8641] allow subscriber applications to request a continuous customized stream of updates from a YANG datastore without needing to poll. It defines a mechanism (i.e., update trigger) to determine when an update record needs to be generated. Two types of subscriptions are introduced in [RFC8641], distinguished by how updates are triggered: periodic and on-change.

*Periodic subscription allows subscribed data to be streamed to the destination at a configured fixed periodic interval;

*On-change subscription allows update to be triggered whenever a change in the subscribed information is detected.

However in some large scale deployments (e.g., massive data collection for wireless network performance monitoring) where an increased data collection rate is used, it becomes more likely that both clients and servers are temporarily overwhelmed with a burst of streamed data and consumes expensive network resource (e.g., bandwidth resource, radio resource) and computation resource, therefore hard to continuously monitor operational data, especially values that fall outside normal operational ranges. If the rate at which we can collect a stream of data is set too low or chosen to get low priority telemetry data dropped, these telemetry data are not sufficient to detect and diagnose problems and verify correct network behavior.

A client might choose to monitor the operational state and send a request to modify the data collection rate on the server. But how often the client evaluates if the modification of the data collection rate is required highly depends on the current collection rate, collecting a stream of data at a low rate prevents the subscriber from capturing sufficient data for timely decision-making, which may result in service discontinuity. In addition, when tens of thousands of network devices need to be managed, frequent follow-up modification requests are prone to errors.

There is a need for a service to balance between data management cost and real time streaming telemetry. To achieve this, servers can be configured with multiple different period intervals and corresponding subscription update policy which allows servers/publishers automatically switch to different period intervals according to the network condition change without the interaction with the client for policy update instruction, e.g., when the wireless signal strength falls below a configured threshold, the subscribed data can be streamed at a higher rate to capture potentially important data and events (e.g., continuous service degeneration); while when the wireless signal strength crosses a configured threshold, the subscribed data can be streamed at a lower rate.

This document defines a YANG data model and associated mechanism enabling the subscriber's adaptive subscriptions to a publisher's event streams. Applying these elements allows servers to automatically adjust the rate and volume of telemetry traffic sent from a publisher to receivers.

1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in

BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

The following terms are defined in [RFC5277] [RFC7950] [RFC3198] [RFC8342] [RFC8639] [RFC8641] and are not redefined here:

- *Event
- *Client
- *Configuration
- *Configured subscription
- *Configuration datastore
- *Notification message
- *Publisher
- *Receiver
- *Subscriber
- *Subscription
- *On-change subscription
- *Periodic subscription
- *Selection filter

This document defines the following term:

Adaptive Subscription: Apply subscription update policy on the servers and allow servers/publishers automatically switch to different period intervals according to the network condition change without the interaction with the client for update policy instruction.

2. Model Overview

This document defines a YANG module "ietf-adaptive-subscription", which augments the "update-trigger" choice defined in the "ietf-yang-push" module [RFC8641] with subscription configuration parameters that are specific to a subscriber's adaptive subscription.

In addition to subscription state notifications defined in [RFC8639] and notifications for subscribed content defined in [RFC8641],

"ietf-adaptive-subscription" YANG module also defines "adaptive-period-update" notification to report the update interval change.

The following tree diagrams [RFC8340] provide an overview of the data model for "ietf-adaptive-subscription" module.

```

module: ietf-adaptive-subscription
  augment /sn:subscriptions/sn:subscription/yp:update-trigger:
    +--rw (adaptive-subscription)?
      +--:(adaptive-subscriptions)
        +--rw adaptive-subscriptions
          +--rw adaptive-period* [name]
            +--rw name string
            +--rw xpath-external-eval string
            +--rw period yp:centiseconds
            +--rw anchor-time? yang:date-and-time
  augment /sn:establish-subscription/sn:input/yp:update-trigger:
    +-- (adaptive-subscription)?
      +--:(adaptive-subscriptions)
        +--rw adaptive-subscriptions
          +--rw adaptive-period* [name]
            +--rw name string
            +--rw xpath-external-eval string
            +--rw period yp:centiseconds
            +--rw anchor-time? yang:date-and-time
  notifications:
    +---n adaptive-period-update
      +--ro id? sn:subscription-id
      +--ro period yp:centiseconds
      +--ro anchor-time? yang:date-and-time
      +--ro (selection-filter)?
        +--:(by-reference)
          | +--ro selection-filter-ref selection-filter-re
        +--:(within-subscription)
          +--ro (filter-spec)?
            +--:(datastore-subtree-filter)
              | +--ro datastore-subtree-filter? <anydata> {sn:subtr
            +--:(datastore-xpath-filter)
              +--ro datastore-xpath-filter? yang:xpath1.0 {sn:x

```

2.1. Subscription Configuration

For adaptive subscriptions, triggered updates will occur at the boundaries of specified time intervals when a trigger condition is satisfied. These boundaries can be calculated from the following adaptive periodic parameters:

*a "name" represents the name of each adaptive period;

*a "period" that defines the new duration between push updates.
The period can be switched based on trigger conditions;

*an "anchor-time"; update intervals fall on the points in time that are a multiple of a "period" from an "anchor-time". If an "anchor-time" is not provided, then the "anchor-time" MUST be set with the creation time of the initial update record.

*an "xpath-external-eval" represents a standard XPath evaluation expression (See section 6.4 of [RFC7950]) that is applied against the targeted data object, which is used to trigger/control the update interval switching within the server. It follows the rules defined in section 3.4 of [XPath1.0] and contains comparisons of the targeted datastore node with its value to the specific threshold in the XPath format. Different from selection filter defined in [RFC8641],

- it is applied against a single targeted object rather than a set of target objects.

- it monitors a specific data object change and evaluates the trigger condition associated with the targeted object to be true or false using XPath rules and does not influence the event records output generation from a publisher.

How often the XPath expression criterion is evaluated is up to the publisher's implementation. With minimal delay, the expression can be evaluated whenever changes to targeted object occur, or at the end of each high-frequency streaming update period. To reduce the frequency of evaluation, the server can choose to check targeted object change at every multiple (e.g., 2 or 3) high-frequency streaming update periods.

The represented expression defined in "xpath-external-eval" is evaluated in the following XPath context:

- The set of namespace declarations is the set of prefix and namespace pairs for all YANG modules implemented by the server, where the prefix is the YANG module name and the namespace is as defined by the "namespace" statement in the YANG module.

- If the leaf is encoded in XML, all namespace declarations in scope on the "xpath-external-eval" leaf element are added to the set of namespace declarations. If a prefix found in the XML is already present in the set of namespace declarations, the namespace in the XML is used.

- The set of variable bindings is empty.

- The function library is the core function library defined in [XPath1.0] and the function defined in Section 10 in RFC 7950.
- The context node is the root node.

For the cases where multiple list instances are needed to handle in "xpath-external-eval", XPath abbreviated syntax can be used to identify a particular instance, e.g., to represent a comparison for a leaf in a list entry:

```
/if:interfaces/if:interface[if:name="eth0"]/if:in-errors>1000.
```

The server MUST convert the XPath expression defined in "xpath-external-eval" to a boolean value and internally apply the "boolean" function defined in Section 4.3 in [XPath1.0] if the evaluated result is not a boolean.

Note that the adaptive subscription may not be supported by every YANG datastore nodes. A publisher MAY decide to simply reject an adaptive subscription with "adaptive-unsupported" (defined in [Section 2.2.1.1](#)) if the scope of the subscription contains selected data nodes for which adaptive subscription is not supported.

2.2. YANG RPC

2.2.1. "establish-subscription" RPC

The augmentation of YANG module "ietf-yang-push" made to RPCs specified in YANG module "ietf-subscribed-notifications" [RFC8639] is introduced. This augmentation concerns the "establish-subscription" RPC, which is augmented with parameters that are needed to specify a subscriber's adaptive subscriptions. These parameters are the same as ones defined in [Section 2.1](#).

2.2.1.1. RPC Failures

As specified in [RFC8639] and [RFC8641], RPC error responses from the publisher are used to indicate a rejection of an RPC for any reason. This document introduces three new RPC errors for "establish-subscription" RPC.

```
establish-subscription
-----
adaptive-unsupported
xpath-evaluation-unsupported
multi-xpath-criteria-conflict
```

Adaptive-unsupported is used to indicate that the adaptive subscription is not supported for any objects that are selectable by the filter.

Xpath-evaluation-unsupported is used to indicate that a server fails to parse syntax defined in "xpath-external-eval". The failure can be caused by either a syntax error or some XPath 1.0 syntax not supported against the specific object.

Multi-xpath-criteria-conflict is used to indicate that the multiple Xpath evaluation criteria represented by "xpath-external-eval" is evaluated as conflict, i.e., more than one condition expressions are evaluated to "true". Such a conflict may also cause an ongoing adaptive-subscription terminated.

For an example of how above RPC errors can be returned, see the "xpath-evaluation-unsupported" error response illustrated in [Appendix B.3](#).

2.3. Notifications for Adaptive Subscribed Content

The adaptive update notification is similar to subscription state change notifications defined in [RFC8639]. It is inserted into the sequence of notification messages sent to a particular receiver. The adaptive update notification cannot be dropped or filtered out, it cannot be stored in replay buffers, and it is delivered only to impacted receivers of a subscription. The identification of adaptive update notification is easy to separate from other notification messages through the use of the YANG extension "subscription-state-notif". This extension tags a notification as a subscription state change notification.

The objects in the 'adaptive-period-update' notification include:

- *a "period" that defines the duration between push updates, the period can be changed based on trigger conditions.
- *an "anchor-time"; update intervals fall on the points in time that are a multiple of a "period" from an "anchor-time". If an "anchor-time" is not provided, then the "anchor-time" MUST be set with the creation time of the initial update record.
- *A selection filter is to identify YANG nodes of interest in a datastore. Filter contents are specified via a reference to an existing filter or via an in-line definition for only that subscription based on XPath Evaluation criteria defined in section 6.4 of [RFC7950]. Referenced filters allow an implementation to avoid evaluating filter acceptability during a dynamic subscription request. The "case" statement differentiates the options. Note that filter contents are not affected by "xpath-external-eval" parameter defined by the update trigger.

3. XPath Complexity Evaluation

YANG-Push subscriptions [RFC8641] specify selection filters to identify targeted YANG datastore nodes and/or datastore subtrees for which updates are to be pushed. In addition, it specifies update policies which contain conditions that trigger generation and pushing of new update records. To support a subscriber's adaptive subscription defined in this document, the trigger condition can also use similar selection filters to express a standard XPath Evaluation criterion (section 6.4 of [RFC7950]) against targeted data objects.

Similar to on-change subscriptions, adaptive subscriptions are particularly effective for data that changes infrequently, the following complex design choices need to be cautious, although these designs have already been well supported by the section 3.4 of [XPATH1.0]:

- *Support XPath Evaluation criteria against every data object;
- *Support more than one target object selection and operation(e.g., addition, subtraction, division and multiplication) in the XPath evaluation criterion;
- *Support any type of node set in the XPath evaluation criterion, e.g., string,int64, uint64, and decimal64 types;
- *Both objects in the XPath Evaluation criterion to be compared are node-sets;
- *Two objects to be compared are in different data types, e.g., one is an integer, the other is a string

As described in section 6.4 of RFC7950, Numbers in XPath 1.0 are IEEE 754 [IEEE754-2008] double-precision floating-point values; some values of int64, uint64, and decimal64 types cannot be exactly represented in XPath expressions.

If two objects to be compared are in different data types, conversion function is needed to convert different data types into numbers.

If both objects in XPath Evaluation criteria to be compared are node-sets, more computation resources are required which add complexity.

To reduce these complexities, the following design principles are recommended:

- *XPath Evaluation criteria against a minimal set of data objects in the data model, the minimal set of data objects can be advertised using Notification capabilities model defined in [RFC9196].

- *XPath Evaluation criteria only support condition expressions that filter updates based on numbers.

- *One object to be compared in the XPath Evaluation criteria MUST be a leaf data node.

- *The other object to be compared in the XPath Evaluation criteria MUST be a number data type.

If a server receives an XPath Evaluation criterion with some XPath syntax unsupported against the specific object, an RPC error with "xpath-evaluation-unsupported" should be returned.

4. Adaptive Subscription YANG Module

<CODE BEGINS> file "ietf-adaptive-subscription@2020-02-14.yang"

```
module ietf-adaptive-subscription {
  yang-version 1.1;

5. IANA Considerations

5.1. Updates to the IETF XML Registry

This document registers one URI in the IETF XML registry [RFC3688]. Following the format in [RFC3688], the following registration is requested to be made:

```
-----  
URI: urn:ietf:params:xml:ns:yang:ietf-adaptive-subscription  
Registrant Contact: The IESG.  
XML: N/A, the requested URI is an XML namespace.  
-----
```

5.2. Updates to the YANG Module Names Registry

This document registers one YANG module in the YANG Module Names registry [RFC7950]. Following the format in [RFC6020], the following registration is requested to be made:

```
-----  
Name:          ietf-adaptive-subscription  
Namespace:     urn:ietf:params:xml:ns:yang:ietf-adaptive-subscripti  
Prefix:        as  
Reference:     RFC xxxx  
-----
```

6. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The NETCONF Configuration Access Control Model (NACM) [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on

network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

```
*/sn:subscriptions/sn:subscription/yp:update-trigger/as:adaptive-  
subscriptions/as:adaptive-period/as:period
```

```
*/sn:subscriptions/sn:subscription/yp:update-trigger/as:adaptive-  
subscriptions/as:adaptive-period/as:anchor-time
```

```
*/sn:establish-subscription/sn:input/yp:update-trigger/  
as:adaptive-subscriptions/as:adaptive-period/as:period
```

```
*/sn:establish-subscription/sn:input/yp:update-trigger/  
as:adaptive-subscriptions/as:adaptive-period/as:anchor-time
```

7. Contributors

Thanks Michael Wang, Liang Geng for their major contributions to the initial modeling and use cases.

Appendix A. Example YANG Module

The example YANG module used in this document represents a Wi-Fi Network Diagnostics data specified in [CHIP] which can be used by a Node to assist a user or Administrative Node in diagnosing potential problems.

YANG tree diagram for the "example-wifi-network-diagnostic" module:

```
module: example-wifi-network-diagnostic
  +--rw server
  |   +--rw bssid?                               yang:mac-address

}
```

Appendix B. Adaptive Subscription and Notification Example

The examples within this document use the normative YANG module "ietf-adaptive-subscription" defined in [Section 4](#) and the non-normative example YANG module "example-wifi-network-diagnostic" defined in Appendix A.1.

This section shows some typical adaptive subscription and notification message exchanges.

B.1. "edit-config" Example

The client configures adaptive subscription policy parameters on the server. The adaptive subscription configuration parameters require the server to support two update intervals (i.e., 5 seconds, 60 seconds) and report updates every 60 seconds if the rssi value is greater than or equal to -65dB; If the rssi value is less than -65dB, switch to 5 seconds period value to report updates.

```

<rpc message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <edit-config>
    <target>
      <running/>
    </target>
    <config
      xmlns:xc="urn:ietf:params:xml:ns:netconf:base:1.0">
      <top
        xmlns="http://example.com/schema/1.2/config"
        xmlns:yp="urn:ietf:params:xml:ns:yang:ietf-yang-push">
        <yp:datastore
          xmlns:ds="urn:ietf:params:xml:ns:yang:ietf-datastores">
            ds:running
          </yp:datastore>
          <yp:datastore-xpath-filter
            xmlns:wnd="https://example.com/sample-data/1.0">
              /wnd:example-wifi-network-diagnostic
            </yp:datastore-xpath-filter>
            <as:adaptive-subscriptions
              xmlns:as="urn:ietf:params:xml:ns:yang:ietf-adaptive-subscription">
              <as:adaptive-period>
                <as:xpath-external-eval>
                  /wnd:server/wnd:rssi< -65
                </as:xpath-external-eval>
                <as:period>5</as:period>
              </as:adaptive-period>
              <as:adaptive-period>
                <as:xpath-external-eval>
                  /wnd:server/wnd:rssi>=-65
                </as:xpath-external-eval>
                <as:period>60</as:period>
              </as:adaptive-period>
            </as:adaptive-subscriptions>
          </top>
        </config>
      </edit-config>
    </rpc>

```

B.2. Create Adaptive Subscription Example

The subscriber sends an "establish-subscription" RPC with the parameters listed in [to request the creation of an adaptive subscription. The adaptive subscription configuration parameters require the server to report updates every 5 seconds if the rssi value is less than -65dB; If the rssi value is greater than or equal to -65dB, switch to 60 seconds period value. \(Section 2\)](#)

```

<netconf:rpc message-id="101"
  xmlns:netconf="urn:ietf:params:xml:ns:netconf:base:1.0">
  <establish-subscription
    xmlns="urn:ietf:params:xml:ns:yang:ietf-subscribed-notifications"
    xmlns:yp="urn:ietf:params:xml:ns:yang:ietf-yang-push">
    <yp:datastore
      xmlns:ds="urn:ietf:params:xml:ns:yang:ietf-datastores">
      ds:running
    </yp:datastore>
    <yp:datastore-xpath-filter
      xmlns:wnd="https://example.com/sample-data/1.0">
      /wnd:example-wifi-network-diagnostic
    </yp:datastore-xpath-filter>
    <as:adaptive-subscriptions
      xmlns:as="urn:ietf:params:xml:ns:yang:ietf-adaptive-subscription">
      <as:adaptive-period>
        <as:xpath-external-eval>
          wnd:server/wnd:rssi<-65
        </as:xpath-external-eval>
        <as:period>5</as:period>
      </as:adaptive-period>
      <as:adaptive-period>
        <as:xpath-external-eval>
          wnd:server/wnd:rssi>=-65
        </as:xpath-external-eval>
        <as:period>60</as:period>
      </as:adaptive-period>
    </as:adaptive-subscriptions>
  </establish-subscription>
</netconf:rpc>

```

B.3. "xpath-evaluation-unsupported" error response example

If the subscriber has authorization to establish the subscription with a server, but the server had not been able to fully satisfy the request from the subscriber, the server should send an RPC error response.

For instance, if the XPATH 1.0 syntax against the targeted data object defined in "xpath-external-eval" is not supported by the server's implementation, the server returns a reply indicating a failure. The following <rpc-reply> illustrates an example:

```

<?xml version="1.0" encoding="utf-8"?>
<rpc-reply xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="1"
  <rpc-error>
    <error-type>application</error-type>
    <error-tag>invalid-value</error-tag>
    <error-severity>error</error-severity>
    <error-app-tag>
      ietf-adaptive-subscription:xpath-evaluation-unsupported
    </error-app-tag>
    <error-path xmlns:wnd="https://example.com/sample-data/1.0">
      /wnd:server/wnd:rssi
    </error-path>
  </rpc-error>
</rpc-reply>

```

Since adaptive subscription allows a server to be configured with multiple different period intervals and corresponding XPath evaluation criteria to trigger update interval switch in the server, it may be possible for the server to return multiple <rpc-error> elements with "xpath-evaluation-unsupported" failure specified by different error paths. The subscriber can use this information in future attempts to establish a subscription.

B.4. "adaptive-period-update" notification example

Upon the server switches from the update interval 5 seconds to the new update interval 60 seconds, before sending event records to receivers, the "adaptive-period-update" notification should be generated and sent to the receivers to inform the receivers that the update interval value is switched to the new value.

```

<notification
  xmlns="urn:ietf:params:xml:ns:netconf:notification:1.0"
  xmlns:yp="urn:ietf:params:xml:ns:yang:ietf-yang-push">
  <eventTime>2016-11-21T13:51:00Z</eventTime>
  <adaptive-period-update
    xmlns="http://example.com/ietf-adaptive-subscription">
    <id>0</id>
    <period>60</period>
    <yp:datastore
      xmlns:ds="urn:ietf:params:xml:ns:yang:ietf-datastores">
        ds:running
      </yp:datastore>
    <yp:datastore-xpath-filter
      xmlns:ex="https://example.com/sample-data/1.0">
        /ex:example-wifi-network-diagnostic
      </yp:datastore-xpath-filter>
    </adaptive-period-update>
  </notification>

```

B.5. Changes between Revisions

v09 -v10

- *Change the draft intended status to "experimental"

- *Problem statement refinement

v08 -v09

- *Define two new RPC errors to report when adaptive subscription unsupported or multiple XPath criteria conflict.

- *Remove the "watermark" parameter.

- *Add clarification about how to evaluate the XPath expression defined in "xpath-external-eval".

- *Add clarification about how to compare a targeted data object in a specific list entry.

v07 -v08

- *Define a new RPC error to report when an XPath syntax defined in "xpath-external-eval" is unsupported by a server.

- *Add a new example showing how the RPC error being returned by a publisher.

- *The usage examples fixed in the Appendix.

- *Grammatical errors correction(missing articles, plurality mismatches, etc).

v06 -v07

- *The usage examples typo fixed in the Appendix.

- *Add reference to RFC7950 XPATH Evaluation section and XPATH 1.0

- *Clarify the definitions of 'xpath-external-eval' and 'selection-filter' by reusing XPATH Evaluation rules in RFC7950.

- *Add a new terminology "adaptive subscription".

- *Add one section to discuss Arbitrary XPath Complexity.

v05 -v06

- *Replace example-wifi-mac module with example-wifi-network-diagnostic using WIFI statistics specified in CHIP specification.

- *Update adaptive subscription Example to align with WIFI example module change.

- *Add one more reference to CHIP Specification.

v04 -v05

- *Remove "modify-subscption" RPC usage.

- *Module update to fix the nits.

- *Update adaptive subscription Example.

- *Other Editorial changes.

v03 - v04

- *Add missing subtrees and data nodes in the security section;

- *Change "adaptive-update" notification into "adaptive-period-update" notification;

- *Other Editorial changes.

v02 - v03

- *Clarify the difference between low priority telemetry data dropping and collection rate switching in the introduction section;

- *Update the abstract and introduction section to focus on collection rate switching in the server without interaction with the remote client;

- *Format usage example and change ssid into rssi in the appendix;

- *Use boilerplate and reuse the terms in the terminology section.
