YANG Data Types and Groupings for Cryptography
draft-ietf-netconf-crypto-types-24

Abstract

This document presents a YANG 1.1 ([RFC 7950](#)) module defining identities, typedefs, and groupings useful to cryptographic applications.

Editorial Note (To be removed by RFC Editor)

This draft contains placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

- * AAAA --> the assigned RFC value for this draft

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

- * 2022-07-07 --> the publication date of this draft

The following Appendix section is to be removed prior to publication:

- * [Appendix A](#). Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Draft YANG Data Types and Groupings for Crypto

July 2022

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 8 January 2023.

[1.](#) Introduction

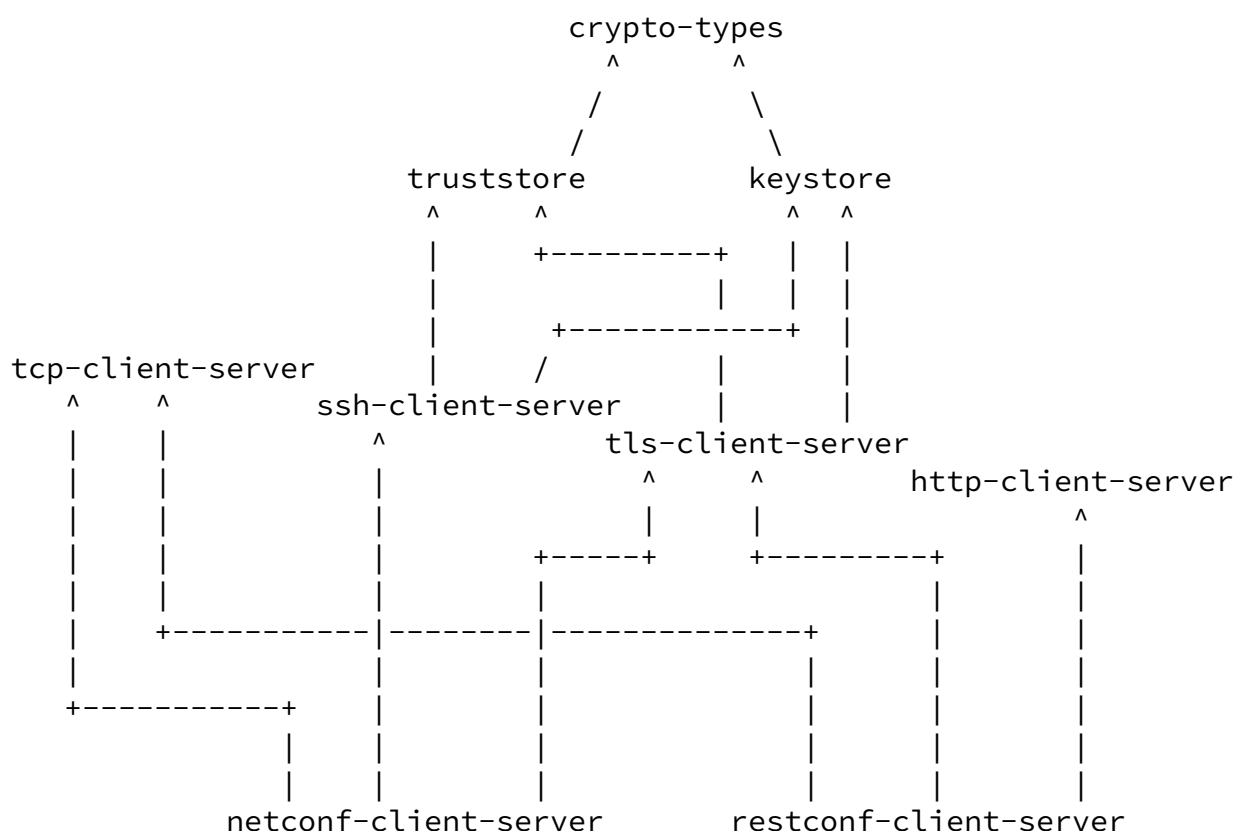

This document presents a YANG 1.1 [[RFC7950](#)] module defining identities, typedefs, and groupings useful to cryptographic applications.

[1.1.](#) Relation to other RFCs

This document presents one or more YANG modules [[RFC7950](#)] that are part of a collection of RFCs that work together to, ultimately, enable the configuration of the clients and servers of both the NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)] protocols.

The modules have been defined in a modular fashion to enable their use by other efforts, some of which are known to be in progress at the time of this writing, with many more expected to be defined in time.

The normative dependency relationship between the various RFCs in the collection is presented in the below diagram. The labels in the diagram represent the primary purpose provided by each RFC. Hyperlinks to each RFC are provided below the diagram.

Label in Diagram	Originating RFC
crypto-types	[I-D.ietf-netconf-crypto-types]
truststore	[I-D.ietf-netconf-trust-anchors]
keystore	[I-D.ietf-netconf-keystore]
tcp-client-server	[I-D.ietf-netconf-tcp-client-server]
ssh-client-server	[I-D.ietf-netconf-ssh-client-server]
tls-client-server	[I-D.ietf-netconf-tls-client-server]
http-client-server	[I-D.ietf-netconf-http-client-server]
netconf-client-server	[I-D.ietf-netconf-netconf-client-server]
restconf-client-server	[I-D.ietf-netconf-restconf-client-server]

Table 1: Label to RFC Mapping

[1.2.](#) Specification Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

[1.3.](#) Adherence to the NMDA

This document is compliant with the Network Management Datastore Architecture (NMDA) [[RFC8342](#)]. It does not define any protocol accessible nodes that are "config false".

[1.4.](#) Conventions

Various examples used in this document use a placeholder value for binary data that has been base64 encoded (e.g., "BASE64VALUE="). This placeholder value is used as real base64 encoded structures are often many lines long and hence distracting to the example being presented.

[2.](#) The "ietf-crypto-types" Module

This section defines a YANG 1.1 [[RFC7950](#)] module called "ietf-crypto-types". A high-level overview of the module is provided in [Section 2.1](#). Examples illustrating the module's use are provided in Examples ([Section 2.2](#)). The YANG module itself is defined in [Section 2.3](#).

[2.1.](#) Data Model Overview

This section provides an overview of the "ietf-crypto-types" module in terms of its features, identities, typedefs, and groupings.

[2.1.1.](#) Features

The following diagram lists all the "feature" statements defined in the "ietf-crypto-types" module:

Features:

- +-- hidden-keys
- +-- password-encryption
- +-- private-key-encryption
- +-- symmetric-key-encryption
- +-- one-symmetric-key-format
- +-- one-asymmetric-key-format
- +-- cms-encrypted-data-format
- +-- cms-enveloped-data-format
- +-- certificate-expiration-notification
- +-- symmetrically-encrypted-value-format
- +-- asymmetrically-encrypted-value-format
- +-- certificate-signing-request-generation

| The diagram above uses syntax that is similar to but not
| defined in [[RFC8340](#)].

[2.1.2.](#) Identities

The following diagram illustrates the relationship amongst the "identity" statements defined in the "ietf-crypto-types" module:

Identities:

- +-- public-key-format
 - | +-- subject-public-key-info-format
 - | +-- ssh-public-key-format
- +-- private-key-format
 - | +-- rsa-private-key-format
 - | +-- ec-private-key-format
 - | +-- one-asymmetric-key-format

```

|           {one-asymmetric-key-format}?
+-- symmetric-key-format
|   +-- octet-string-key-format
|   +-- one-symmetric-key-format
|       {one-symmetric-key-format}?
+-- encrypted-value-format
    +-- symmetrically-encrypted-value-format
        | | {symmetrically-encrypted-value-format}?
        | +-- cms-encrypted-data-format
        |     {cms-encrypted-data-format}?
    +-- asymmetrically-encrypted-value-format
        | {asymmetrically-encrypted-value-format}?
        +-- cms-enveloped-data-format
            {cms-enveloped-data-format}?

```

| The diagram above uses syntax that is similar to but not
| defined in [[RFC8340](#)].

Comments:

- * The diagram shows that there are four base identities. The first three identities are used to indicate the format that key data, while the fourth identity is used to indicate the format for encrypted values. The base identities are "abstract", in the object oriented programming sense, in that they only define a "class" of formats, rather than a specific format.
- * The various "leaf" identities define specific encoding formats. The derived identities defined in this document are sufficient for the effort described in [Section 1.1](#) but, by nature of them being identities, additional derived identities MAY be defined by future efforts.
- * Identities used to specify uncommon formats are enabled by "feature" statements, allowing applications to support them when needed.

The following diagram illustrates the relationship amongst the "typedef" statements defined in the "ietf-crypto-types" module:

Typedefs:

```
binary
  +-- csr-info
  +-- csr
  +-- x509
  |   +-- trust-anchor-cert-x509
  |   +-- end-entity-cert-x509
  +-- crl
  +-- ocsp-request
  +-- ocsp-response
  +-- cms
      +-- data-content-cms
      +-- signed-data-cms
      |   +-- trust-anchor-cert-cms
      |   +-- end-entity-cert-cms
      +-- enveloped-data-cms
      +-- digested-data-cms
      +-- encrypted-data-cms
      +-- authenticated-data-cms
```

```
| The diagram above uses syntax that is similar to but not
| defined in [RFC8340].
```

Comments:

- * All the typedefs defined in the "ietf-crypto-types" module extend the "binary" type defined in [[RFC7950](#)].
- * Additionally, all the typedefs define a type for encoding an ASN.1 [[ITU.X680.2015](#)] structure using DER [[ITU.X690.2015](#)].
- * The "trust-anchor-*" and "end-entity-*" typedefs are syntactically identical to their base typedefs and only distinguish themselves by the expected nature of their content. These typedefs are defined to facilitate common modeling needs.

[2.1.4](#). Groupings

The "ietf-crypto-types" module defines the following "grouping" statements:

- * encrypted-value-grouping
- * password-grouping

- * symmetric-key-grouping
- * public-key-grouping
- * asymmetric-key-pair-grouping
- * trust-anchor-cert-grouping
- * end-entity-cert-grouping
- * generate-csr-grouping
- * asymmetric-key-pair-with-cert-grouping
- * asymmetric-key-pair-with-certs-grouping

Each of these groupings are presented in the following subsections.

[2.1.4.1](#). The "encrypted-value-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "encrypted-value-grouping" grouping:

```
grouping encrypted-value-grouping:
  +-- encrypted-by
  +-- encrypted-value-format      identityref
  +-- encrypted-value            binary
```

Comments:

- * The "encrypted-by" node is an empty container (difficult to see in the diagram) that a consuming module MUST augment key references into. The "ietf-crypto-types" module is unable to populate this container as the module only defines groupings. [Section 2.2.1](#) presents an example illustrating a consuming module populating the "encrypted-by" container.
- * The "encrypted-value" node is the value, encrypted by the key referenced by the "encrypted-by" node, and encoded in the format appropriate for the kind of key it was encrypted by.
 - If the value is encrypted by a symmetric key, then the encrypted value is encoded using the format associated with the "symmetrically-encrypted-value-format" identity.
 - If the value is encrypted by an asymmetric key, then the encrypted value is encoded using the format associated with the "asymmetrically-encrypted-value-format" identity.

See [Section 2.1.2](#) for information about the "format" identities.

[2.1.4.2](#). The "password-grouping" Grouping

This section presents two tree diagrams [[RFC8340](#)] illustrating the "password-grouping" grouping. The first tree diagram does not expand the internally used grouping statement(s):

```
grouping password-grouping:
  +-- (password-type)
    +--:(cleartext-password)
      | +-- cleartext-password?  string
    +--:(encrypted-password) {password-encryption}?
      +-- encrypted-password
        +---u encrypted-value-grouping
```

The following tree diagram expands the internally used grouping statement(s), enabling the grouping's full structure to be seen:

```
grouping password-grouping:
  +-- (password-type)
    +--:(cleartext-password)
      | +-- cleartext-password?  string
    +--:(encrypted-password) {password-encryption}?
      +-- encrypted-password
        +-- encrypted-by
        +-- encrypted-value-format  identityref
        +-- encrypted-value        binary
```

Comments:

- * For the referenced grouping statement(s):
 - The "encrypted-value-grouping" grouping is discussed in [Section 2.1.4.1](#).
- * The "choice" statement enables the password data to be cleartext or encrypted, as follows:
 - The "cleartext-password" node can encode any cleartext value.
 - The "encrypted-password" node's structure is discussed in

[Section 2.1.4.1.](#)

[2.1.4.3.](#) The "symmetric-key-grouping" Grouping

This section presents two tree diagrams [[RFC8340](#)] illustrating the "symmetric-key-grouping" grouping. The first tree diagram does not expand the internally used grouping statement(s):

Watsen

Expires 8 January 2023

[Page 10]

Internet-Draft YANG Data Types and Groupings for Crypto

July 2022

```
grouping symmetric-key-grouping:
  +-- key-format?          identityref
  +-- (key-type)
    +--:(cleartext-key)
      | +-- cleartext-key?  binary
    +--:(hidden-key) {hidden-keys}?
      | +-- hidden-key?    empty
    +--:(encrypted-key) {symmetric-key-encryption}?
      +-- encrypted-key
        +---u encrypted-value-grouping
```

The following tree diagram expands the internally used grouping statement(s), enabling the grouping's full structure to be seen:

```
grouping symmetric-key-grouping:
  +-- key-format?          identityref
  +-- (key-type)
    +--:(cleartext-key)
      | +-- cleartext-key?  binary
    +--:(hidden-key) {hidden-keys}?
      | +-- hidden-key?    empty
    +--:(encrypted-key) {symmetric-key-encryption}?
      +-- encrypted-key
        +-- encrypted-by
        +-- encrypted-value-format  identityref
        +-- encrypted-value        binary
```

Comments:

- * For the referenced grouping statement(s):
 - The "encrypted-value-grouping" grouping is discussed in

[Section 2.1.4.1.](#)

- * The "key-format" node is an identity-reference to the "symmetric-key-format" abstract base identity discussed in [Section 2.1.2](#), enabling the symmetric key to be encoded using the format defined by any of the derived identities.
- * The "choice" statement enables the private key data to be cleartext, encrypted, or hidden, as follows:
 - The "cleartext-key" node can encode any cleartext key value.
 - The "hidden-key" node is of type "empty" as the real value cannot be presented via the management interface.
 - The "encrypted-key" node's structure is discussed in [Section 2.1.4.1](#).

[2.1.4.4.](#) The "public-key-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "public-key-grouping" grouping:

```
grouping public-key-grouping:
  +-- public-key-format      identityref
  +-- public-key             binary
```

Comments:

- * The "public-key-format" node is an identity-reference to the "public-key-format" abstract base identity discussed in [Section 2.1.2](#), enabling the public key to be encoded using the format defined by any of the derived identities.
- * The "public-key" node is the public key data in the selected format. No "choice" statement is used to hide or encrypt the public key data because it is unnecessary to do so for public keys.

[2.1.4.5.](#) The "asymmetric-key-pair-grouping" Grouping

This section presents two tree diagrams [[RFC8340](#)] illustrating the "asymmetric-key-pair-grouping" grouping. The first tree diagram does

not expand the internally used grouping statement(s):

```
grouping asymmetric-key-pair-grouping:
+---u public-key-grouping
+-- private-key-format?          identityref
+-- (private-key-type)
  +--:(cleartext-private-key)
  | +-- cleartext-private-key?    binary
  +--:(hidden-private-key) {hidden-keys}?
  | +-- hidden-private-key?      empty
  +--:(encrypted-private-key) {private-key-encryption}?
    +-- encrypted-private-key
      +---u encrypted-value-grouping
```

The following tree diagram expands the internally used grouping statement(s), enabling the grouping's full structure to be seen:

```
grouping asymmetric-key-pair-grouping:
+-- public-key-format          identityref
+-- public-key                 binary
+-- private-key-format?       identityref
+-- (private-key-type)
  +--:(cleartext-private-key)
  | +-- cleartext-private-key?    binary
  +--:(hidden-private-key) {hidden-keys}?
  | +-- hidden-private-key?      empty
  +--:(encrypted-private-key) {private-key-encryption}?
    +-- encrypted-private-key
      +-- encrypted-by
      +-- encrypted-value-format  identityref
      +-- encrypted-value        binary
```

Comments:

* For the referenced grouping statement(s):

- The "public-key-grouping" grouping is discussed in [Section 2.1.4.4](#).
- The "encrypted-value-grouping" grouping is discussed in [Section 2.1.4.1](#).
- * The "private-key-format" node is an identity-reference to the "private-key-format" abstract base identity discussed in [Section 2.1.2](#), enabling the private key to be encoded using the format defined by any of the derived identities.
- * The "choice" statement enables the private key data to be cleartext, encrypted, or hidden, as follows:
 - The "cleartext-private-key" node can encode any cleartext key value.
 - The "hidden-private-key" node is of type "empty" as the real value cannot be presented via the management interface.
 - The "encrypted-private-key" node's structure is discussed in [Section 2.1.4.1](#).

[2.1.4.6](#). The "certificate-expiration-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "certificate-expiration-grouping" grouping:

```

grouping certificate-expiration-grouping:
  +---n certificate-expiration
      {certificate-expiration-notification}?
      +-- expiration-date      yang:date-and-time
  
```

Comments:

- * This grouping's only purpose is to define the "certificate-expiration" notification statement, used by the groupings defined in [Section 2.1.4.7](#) and [Section 2.1.4.8](#).
- * The "certificate-expiration" notification enables servers to notify clients when certificates are nearing expiration.
- * The "expiration-date" node indicates when the designated certificate will (or did) expire.

- * Identification of the certificate that is expiring is built into the notification itself. For an example, please see [Section 2.2.3](#).

[2.1.4.7](#). The "trust-anchor-cert-grouping" Grouping

This section presents two tree diagrams [[RFC8340](#)] illustrating the "trust-anchor-cert-grouping" grouping. The first tree diagram does not expand the internally used grouping statement(s):

```
grouping trust-anchor-cert-grouping:
  +-- cert-data?                               trust-anchor-cert-cms
  +---u certificate-expiration-grouping
```

The following tree diagram expands the internally used grouping statement(s), enabling the grouping's full structure to be seen:

```
grouping trust-anchor-cert-grouping:
  +-- cert-data?                               trust-anchor-cert-cms
  +---n certificate-expiration
      {certificate-expiration-notification}?
      +-- expiration-date    yang:date-and-time
```

Comments:

- * For the referenced grouping statement(s):
 - The "certificate-expiration-grouping" grouping is discussed in [Section 2.1.4.6](#).
- * The "cert-data" node contains a chain of one or more certificates encoded using a "signed-data-cms" typedef discussed in [Section 2.1.3](#).

[2.1.4.8](#). The "end-entity-cert-grouping" Grouping

This section presents two tree diagrams [[RFC8340](#)] illustrating the "end-entity-cert-grouping" grouping. The first tree diagram does not

expand the internally used grouping statement(s):

```
grouping end-entity-cert-grouping:
  +-- cert-data?                               end-entity-cert-cms
  +---u certificate-expiration-grouping
```

The following tree diagram expands the internally used grouping statement(s), enabling the grouping's full structure to be seen:

```
grouping end-entity-cert-grouping:
  +-- cert-data?                               end-entity-cert-cms
  +---n certificate-expiration
      {certificate-expiration-notification}?
  +-- expiration-date      yang:date-and-time
```

Comments:

- * For the referenced grouping statement(s):
 - The "certificate-expiration-grouping" grouping is discussed in [Section 2.1.4.6](#).
- * The "cert-data" node contains a chain of one or more certificates encoded using a "signed-data-cms" typedef discussed in [Section 2.1.3](#).

[2.1.4.9](#). The "generate-csr-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "generate-csr-grouping" grouping:

```
grouping generate-csr-grouping:
  +---x generate-csr {csr-generation}?
      +---w input
          | +---w csr-format      identityref
          | +---w csr-info        csr-info
      +--ro output
          +--ro (csr-type)
              +--:(p10-csr)
                  +--ro p10-csr?  p10-csr
```

Comments:

- * This grouping's only purpose is to define the "generate-certificate-signing-request" action statement, used by the groupings defined in [Section 2.1.4.10](#) and [Section 2.1.4.11](#).
- * This action takes as input a "csr-info" type and returns a "csr" type, both of which are discussed in [Section 2.1.3](#).
- * For an example, please see [Section 2.2.2](#).

[2.1.4.10](#). The "asymmetric-key-pair-with-cert-grouping" Grouping

This section presents two tree diagrams [[RFC8340](#)] illustrating the "asymmetric-key-pair-with-cert-grouping" grouping. The first tree diagram does not expand the internally used grouping statement(s):

```
grouping asymmetric-key-pair-with-cert-grouping:
+---u asymmetric-key-pair-grouping
+---u end-entity-cert-grouping
+---u generate-csr-grouping
```

The following tree diagram expands the internally used grouping statement(s), enabling the grouping's full structure to be seen:

```
grouping asymmetric-key-pair-with-cert-grouping:
  +-- public-key-format          identityref
  +-- public-key                 binary
  +-- private-key-format?       identityref
  +-- (private-key-type)
  |   +--:(cleartext-private-key)
  |   |   +-- cleartext-private-key?  binary
  |   +--:(hidden-private-key) {hidden-keys}?
  |   |   +-- hidden-private-key?     empty
  |   +--:(encrypted-private-key) {private-key-encryption}?
  |       +-- encrypted-private-key
  |           +-- encrypted-by
  |           +-- encrypted-value-format  identityref
  |           +-- encrypted-value        binary
  +-- cert-data?                  end-entity-cert-cms
  +---n certificate-expiration
  |       {certificate-expiration-notification}?
  |   +-- expiration-date      yang:date-and-time
  +---x generate-csr {csr-generation}?
  |   +---w input
  |       |   +---w csr-format      identityref
  |       |   +---w csr-info        csr-info
  +---ro output
  |   +---ro (csr-type)
  |       +--:(p10-csr)
  |           +---ro p10-csr?      p10-csr
```

Comments:

- * This grouping defines an asymmetric key with at most one associated certificate, a commonly needed combination in protocol models.
- * For the referenced grouping statement(s):
 - The "asymmetric-key-pair-grouping" grouping is discussed in [Section 2.1.4.5](#).
 - The "end-entity-cert-grouping" grouping is discussed in [Section 2.1.4.8](#).
 - The "generate-csr-grouping" grouping is discussed in

[Section 2.1.4.9.](#)

[2.1.4.11.](#) The "asymmetric-key-pair-with-certs-grouping" Grouping

This section presents two tree diagrams [[RFC8340](#)] illustrating the "asymmetric-key-pair-with-certs-grouping" grouping. The first tree diagram does not expand the internally used grouping statement(s):

```
grouping asymmetric-key-pair-with-certs-grouping:
  +---u asymmetric-key-pair-grouping
  +-- certificates
  |   +-- certificate* [name]
  |       +-- name?                                string
  |       +---u end-entity-cert-grouping
  +---u generate-csr-grouping
```

The following tree diagram expands the internally used grouping statement(s), enabling the grouping's full structure to be seen:

```
grouping asymmetric-key-pair-with-certs-grouping:
  +-- public-key-format            identityref
  +-- public-key                   binary
  +-- private-key-format?          identityref
  +-- (private-key-type)
  |   +--:(cleartext-private-key)
  |   |   +-- cleartext-private-key?    binary
  |   +--:(hidden-private-key) {hidden-keys}?
  |   |   +-- hidden-private-key?      empty
  |   +--:(encrypted-private-key) {private-key-encryption}?
  |       +-- encrypted-private-key
  |           +-- encrypted-by
  |               +-- encrypted-value-format    identityref
  |               +-- encrypted-value          binary
  +-- certificates
  |   +-- certificate* [name]
  |       +-- name?                                string
  |       +-- cert-data                            end-entity-cert-cms
  |       +---n certificate-expiration
  |           {certificate-expiration-notification}?
  |           +-- expiration-date    yang:date-and-time
  +---x generate-csr {csr-generation}?
```

```

+---w input
| +---w csr-format      identityref
| +---w csr-info        csr-info
+--ro output
  +--ro (csr-type)
    +--:(p10-csr)
      +--ro p10-csr?    p10-csr

```

Comments:

- * This grouping defines an asymmetric key with one or more associated certificates, a commonly needed combination in configuration models.
- * For the referenced grouping statement(s):

Watsen

[Page 18]

Internet-Draft YANG Data Types and Groupings for Crypto

July 2022

- The "asymmetric-key-pair-grouping" grouping is discussed in [Section 2.1.4.5](#).
- The "end-entity-cert-grouping" grouping is discussed in [Section 2.1.4.8](#).
- The "generate-csr-grouping" grouping is discussed in [Section 2.1.4.9](#).

[2.1.5](#). Protocol-accessible Nodes

The "ietf-crypto-types" module does not contain any protocol-accessible nodes, but the module needs to be "implemented", as described in [Section 5.6.5 of \[RFC7950\]](#), in order for the identities in [Section 2.1.2](#) to be defined.

[2.2](#). Example Usage

[2.2.1](#). The "symmetric-key-grouping" and "asymmetric-key-pair-with-certs-grouping" Grouping

The following non-normative module is constructed in order to illustrate the use of the "symmetric-key-grouping" ([Section 2.1.4.3](#)), the "asymmetric-key-pair-with-certs-grouping" ([Section 2.1.4.11](#)), and the "password-grouping" ([Section 2.1.4.2](#)) grouping statements.

Notably, this example illustrates a hidden asymmetric key (ex-hidden-asymmetric-key) has been used to encrypt a symmetric key (ex-

encrypted-one-symmetric-based-symmetric-key) that has been used to encrypt another asymmetric key (ex-encrypted-rsa-based-asymmetric-key). Additionally, the symmetric key is also used to encrypt a password (ex-encrypted-password).

<CODE ENDS>

[3.](#) Security Considerations

[3.1.](#) No Support for CRMF

This document uses PKCS #10 [[RFC2986](#)] for the "generate-certificate-signing-request" action. The use of Certificate Request Message Format (CRMF) [[RFC4211](#)] was considered, but it was unclear if there was market demand for it. If it is desired to support CRMF in the future, a backwards compatible solution can be defined at that time.

[3.2.](#) No Support for Key Generation

Early revisions of this document included "rpc" statements for generating symmetric and asymmetric keys. These statements were removed due to an inability to obtain consensus for how to identify the key-algorithm to use. Thusly, the solution presented in this document only supports keys to be configured via an external client, which does not support Security best practice.

[3.3.](#) Unconstrained Public Key Usage

This module defines the "public-key-grouping" grouping, which enables the configuration of public keys without constraints on their usage, e.g., what operations the key is allowed to be used for (encryption, verification, both).

The "asymmetric-key-pair-grouping" grouping uses the aforementioned "public-key-grouping" grouping, and carries the same traits.

The "asymmetric-key-pair-with-cert-grouping" grouping uses the aforementioned "asymmetric-key-pair-grouping" grouping, whereby each certificate may constrain the usage of the public key according to local policy.

[3.4.](#) Unconstrained Private Key Usage

This module defines the "asymmetric-key-pair-grouping" grouping, which enables the configuration of private keys without constraints on their usage, e.g., what operations the key is allowed to be used for (e.g., signature, decryption, both).

The "asymmetric-key-pair-with-cert-grouping" uses the aforementioned "asymmetric-key-pair-grouping" grouping, whereby configured certificates (e.g., identity certificates) may constrain the use of the public key according to local policy.

[3.5.](#) Strength of Keys Conveyed

When accessing key values, it is desirable that implementations ensure that the strength of the keys being accessed is not greater than the strength of the underlying secure transport connection over which the keys are conveyed. However, comparing key strengths can be complicated and difficult to implement in practice.

That said, expert Security opinion suggests that already it is infeasible to break a 128-bit symmetric key using a classical computer, and thus the concern for conveying higher-strength keys begins to lose its allure.

Implementations SHOULD only use secure transport protocols meeting local policy. A reasonable policy may, e.g., state that only ciphersuites listed as "recommended" by the IETF be used (e.g., [\[RFC7525\]](#) for TLS).

[3.6.](#) Encrypting Passwords

The module contained within this document enables passwords to be encrypted. Passwords may be encrypted via a symmetric key using the "cms-encrypted-data-format" format. This format uses the CMS EncryptedData structure, which allows any encryption algorithm to be used.

In order to thwart rainbow attacks, algorithms that result in a unique output for the same input SHOULD NOT be used. For instance, AES using "ECB" SHOULD NOT be used to encrypt passwords, whereas "CBC" mode is permissible since an unpredictable initialization vector (IV) MUST be used for each use.

[3.7.](#) Deletion of Cleartext Key Values

This module defines storage for cleartext key values that SHOULD be zeroized when deleted, so as to prevent the remnants of their persisted storage locations from being analyzed in any meaningful

way.

The cleartext key values are the "cleartext-key" node defined in the "symmetric-key-grouping" grouping ([Section 2.1.4.3](#)) and the "cleartext-private-key" node defined in the "asymmetric-key-pair-grouping" grouping ([Section 2.1.4.5](#)).

[3.8](#). The "ietf-crypto-types" YANG Module

The YANG module in this document defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC8341](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only defines groupings, these considerations are primarily for the designers of other modules that use these groupings.

Some of the readable data nodes defined in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

- * The "cleartext-key" node:

The "cleartext-key" node defined in the "symmetric-key-grouping" grouping is additionally sensitive to read operations such that, in normal use cases, it should never be returned to a client. For this reason, the NACM extension "default-deny-all" has been applied to it.

- * The "cleartext-private-key" node:

The "cleartext-private-key" node defined in the "asymmetric-key-pair-grouping" grouping is additionally sensitive to read operations such that, in normal use cases, it should never be returned to a client. For this reason, the NACM extension "default-deny-all" has been applied.

* The "cert-data" node:

The "cert-data" node, defined in both the "trust-anchor-cert-grouping" and "end-entity-cert-grouping" groupings, is additionally sensitive to read operations, as certificates sometimes convey personally identifying information (especially end-entity certificates). However, as it is commonly understood that certificates are "public", the NACM extension "nacm:default-deny-write" (not "default-deny-all") has been applied. It is RECOMMENDED that implementations adjust read-access to certificates to comply with local policy.

All the writable data nodes defined by all the groupings defined in this module may be considered sensitive or vulnerable in some network environments. For instance, even the modification of a public key or a certificate can dramatically alter the implemented security policy. For this reason, the NACM extension "default-deny-write" has been applied to all the data nodes defined in the module.

Some of the operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

* generate-certificate-signing-request:

This "action" statement SHOULD only be executed by authorized users. For this reason, the NACM extension "default-deny-all" has been applied. Note that NACM uses "default-deny-all" to protect "RPC" and "action" statements; it does not define, e.g., an extension called "default-deny-execute".

For this action, it is RECOMMENDED that implementations assert channel binding [[RFC5056](#)], so as to ensure that the application layer that sent the request is the same as the device authenticated when the secure transport layer was established.

[4.](#) IANA Considerations

[4.1.](#) The "IETF XML" Registry

This document registers one URI in the "ns" subregistry of the "IETF XML" registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration is requested:

URI: urn:ietf:params:xml:ns:yang:ietf-crypto-types
Registrant Contact: The IESG
XML: N/A, the requested URI is an XML namespace.

[4.2.](#) The "YANG Module Names" Registry

This document registers one YANG module in the "YANG Module Names" registry [[RFC6020](#)]. Following the format in [[RFC6020](#)], the following registration is requested:

name: ietf-crypto-types
namespace: urn:ietf:params:xml:ns:yang:ietf-crypto-types
prefix: ct
reference: RFC AAAA

[Appendix A](#). Change Log

This section is to be removed before publishing as an RFC.

[A.1](#). I-D to 00

- * Removed groupings and notifications.
- * Added typedefs for identityrefs.
- * Added typedefs for other [RFC 5280](#) structures.
- * Added typedefs for other [RFC 5652](#) structures.
- * Added convenience typedefs for [RFC 4253](#), [RFC 5280](#), and [RFC 5652](#).

Watsen

Expires 8 January 2023

[Page 57]

Internet-Draft YANG Data Types and Groupings for Crypto

July 2022

[A.2](#). 00 to 01

- * Moved groupings from the [draft-ietf-netconf-keystore](#) here.

[A.3](#). 01 to 02

- * Removed unwanted "mandatory" and "must" statements.

- * Added many new crypto algorithms (thanks Haiguang!)
- * Clarified in `asymmetric-key-pair-with-certs-grouping`, in `certificates/certificate/name/description`, that if the name **MUST NOT** match the name of a certificate that exists independently in `<operational>`, enabling certs installed by the manufacturer (e.g., an IDevID).

[A.4.](#) 02 to 03

- * renamed base identity `'asymmetric-key-encryption-algorithm'` to `'asymmetric-key-algorithm'`.
- * added new `'asymmetric-key-algorithm'` identities for `secp192r1`, `secp224r1`, `secp256r1`, `secp384r1`, and `secp521r1`.
- * removed `'mac-algorithm'` identities for `mac-aes-128-ccm`, `mac-aes-192-ccm`, `mac-aes-256-ccm`, `mac-aes-128-gcm`, `mac-aes-192-gcm`, `mac-aes-256-gcm`, and `mac-chacha20-poly1305`.
- * for all `-cbc` and `-ctr` identities, renamed base identity `'symmetric-key-encryption-algorithm'` to `'encryption-algorithm'`.
- * for all `-ccm` and `-gcm` identities, renamed base identity `'symmetric-key-encryption-algorithm'` to `'encryption-and-mac-algorithm'` and renamed the identity to remove the `"enc-"` prefix.
- * for all the `'signature-algorithm'` based identities, renamed from `'rsa-*` to `'rsassa-*`.
- * removed all of the `"x509v3-"` prefixed `'signature-algorithm'` based identities.
- * added `'key-exchange-algorithm'` based identities for `'rsaes-oaep'` and `'rsaes-pkcs1-v1_5'`.
- * renamed typedef `'symmetric-key-encryption-algorithm-ref'` to `'symmetric-key-algorithm-ref'`.

- * renamed typedef 'asymmetric-key-encryption-algorithm-ref' to 'asymmetric-key-algorithm-ref'.
- * added typedef 'encryption-and-mac-algorithm-ref'.
- * Updated copyright date, boilerplate template, affiliation, and folding algorithm.

[A.5.](#) 03 to 04

- * ran YANG module through formatter.

[A.6.](#) 04 to 05

- * fixed broken symlink causing reformatted YANG module to not show.

[A.7.](#) 05 to 06

- * Added NACM annotations.
- * Updated Security Considerations section.
- * Added 'asymmetric-key-pair-with-cert-grouping' grouping.
- * Removed text from 'permanently-hidden' enum regarding such keys not being backed up or restored.
- * Updated the boilerplate text in module-level "description" statement to match copyeditor convention.
- * Added an explanation to the 'public-key-grouping' and 'asymmetric-key-pair-grouping' statements as for why the nodes are not mandatory (e.g., because they may exist only in <operational>).
- * Added 'must' expressions to the 'public-key-grouping' and 'asymmetric-key-pair-grouping' statements ensuring sibling nodes are either all exist or do not all exist.
- * Added an explanation to the 'permanently-hidden' that the value cannot be configured directly by clients and servers MUST fail any attempt to do so.
- * Added 'trust-anchor-certs-grouping' and 'end-entity-certs-grouping' (the plural form of existing groupings).

- * Now states that keys created in <operational> by the *-hidden-key actions are bound to the lifetime of the parent 'config true' node, and that subsequent invocations of either action results in a failure.

[A.8.](#) 06 to 07

- * Added clarifications that implementations SHOULD assert that configured certificates contain the matching public key.
- * Replaced the 'generate-hidden-key' and 'install-hidden-key' actions with special 'crypt-hash' -like input/output values.

[A.9.](#) 07 to 08

- * Removed the 'generate-key' and 'hidden-key' features.
- * Added grouping symmetric-key-grouping
- * Modified 'asymmetric-key-pair-grouping' to have a 'choice' statement for the keystone module to augment into, as well as replacing the 'union' with leafs (having different NACM settings).

[A.10.](#) 08 to 09

- * Converting algorithm from identities to enumerations.

[A.11.](#) 09 to 10

- * All the below changes are to the algorithm enumerations defined in ietf-crypto-types.
- * Add in support for key exchange over x.25519 and x.448 based on [RFC 8418](#).
- * Add in SHAKE-128, SHAKE-224, SHAKE-256, SHAKE-384 and SHAKE 512
- * Revise/add in enum of signature algorithm for x25519 and x448
- * Add in des3-cbc-sha1 for IPSec
- * Add in sha1-des3-kd for IPSec

- * Add in definit for rc4-hmac and rc4-hmac-exp. These two algorithms have been deprecated in [RFC 8429](#). But some existing draft in i2nsf may still want to use them.
- * Add x25519 and x448 curve for asymmetric algorithms

- * Add signature algorithms ed25519, ed25519-cts, ed25519ph
- * add signature algorithms ed448, ed448ph
- * Add in rsa-sha2-256 and rsa-sha2-512 for SSH protocols ([rfc8332](#))

[A.12.](#) 10 to 11

- * Added a "key-format" identity.
- * Added symmetric keys to the example in [Section 2.2](#).

[A.13.](#) 11 to 12

- * Removed all non-essential (to NC/RC) algorithm types.
- * Moved remaining algorithm types each into its own module.
- * Added a 'config false' "algorithms-supported" list to each of the algorithm-type modules.

[A.14.](#) 12 to 13

- * Added the four features: "[encrypted-]one-[a]symmetric-key-format", each protecting a 'key-format' identity of the same name.
- * Added 'must' expressions asserting that the 'key-format' leaf exists whenever a non-hidden key is specified.
- * Improved the 'description' statements and added 'reference' statements for the 'key-format' identities.
- * Added a questionable forward reference to "encrypted-*" leafs in a couple 'when' expressions.
- * Did NOT move "config false" alg-supported lists to SSH/TLS drafts.

[A.15.](#) 13 to 14

- * Resolved the "FIXME: forward ref" issue by modulating 'must', 'when', and 'mandatory' expressions.
- * Moved the 'generatesymmetric-key' and 'generate-asymmetric-key' actions from ietf-keystore to ietf-crypto-types, now as RPCs.
- * Cleaned up various description statements and removed lingering FIXMEs.

Internet-Draft YANG Data Types and Groupings for Crypto

July 2022

- * Converted the "iana-<alg-type>-algs" YANG modules to IANA registries with instructions for how to generate modules from the registries, whenever they may be updated.

[A.16.](#) 14 to 15

- * Removed the IANA-maintained registries for symmetric, asymmetric, and hash algorithms.
- * Removed the "generate-symmetric-key" and "generate-asymmetric-key" RPCs.
- * Removed the "algorithm" node in the various symmetric and asymmetric key groupings.
- * Added 'typedef csr' and 'feature certificate-signing-request-generation'.
- * Refined a usage of "end-entity-cert-grouping" to make the "cert" node mandatory true.
- * Added a "Note to Reviewers" note to first page.

[A.17.](#) 15 to 16

- * Updated draft title (refer to "Groupings" too).
- * Removed 'end-entity-certs-grouping' as it wasn't being used anywhere.

- * Removed 'trust-anchor-certs-grouping' as it was no longer being used after modifying 'local-or-truststore-certs-grouping' to use lists (not leaf-lists).
- * Renamed "cert" to "cert-data" in trust-anchor-cert-grouping.
- * Added "csr-info" typedef, to complement the existing "csr" typedef.
- * Added "ocsp-request" and "ocsp-response" typedefs, to complement the existing "crl" typedef.
- * Added "encrypted" cases to both symmetric-key-grouping and asymmetric-key-pair-grouping (Moved from Keystore draft).
- * Expanded "Data Model Overview section(s) [remove "wall" of tree diagrams].

- * Updated the Security Considerations section.

[A.18.](#) 16 to 17

- * [Re]-added a "Strength of Keys Configured" Security Consideration
- * Prefixed "cleartext-" in the "key" and "private-key" node names.

[A.19.](#) 17 to 18

- * Fixed issues found by the SecDir review of the "keystore" draft.
- * Added "password-grouping", discussed during the IETF 108 session.

[A.20.](#) 18 to 19

- * Added a "Unconstrained Public Key Usage" Security Consideration to address concern raised by SecDir of the 'truststore' draft.
- * Added a "Unconstrained Private Key Usage" Security Consideration to address concern raised by SecDir of the 'truststore' draft.

- * Changed the encryption strategy, after conferring with Russ Housley.
- * Added a "password-grouping" example to the "crypto-types-usage" example.
- * Added an "Encrypting Passwords" section to Security Consideration.
- * Addressed other comments raised by YANG Doctor.

[A.21.](#) 19 to 20

- * Nits found via YANG Doctors reviews.
- * Aligned modules with `pyang -f` formatting.

[A.22.](#) 20 to 21

- * Replaced "base64encodedvalue==" with "BASE64VALUE=".
- * Accommodated SecDir review by Valery Smyslov.

[A.23.](#) 21 to 22

- * fixup the 'WG Web' and 'WG List' lines in YANG module(s)

[Page 63]

Internet-Draft YANG Data Types and Groupings for Crypto

July 2022

- * fixup copyright (i.e., s/Simplified/Revised/) in YANG module(s)
- * added 'hidden-keys' feature.

[A.24.](#) 22 to 23

- * Fixed an example to reference correct key.
- * Fixed an example to not have line-returns around the encoding for a binary value.

[A.25.](#) 23 to 24

- * Added mandatory leaf "csr-format" to action "generate-csr".

* s/certificate-signing-request/csr/g in the YANG module.

Acknowledgements

The authors would like to thank for following for lively discussions on list and in the halls (ordered by first name): Balazs Kovacs, Eric Voit, Juergen Schoenwaelder, Liang Xia, Martin Bjoerklund, Nick Hancock, Rich Salz, Rob Wilton, Russ Housley, Sandra Murphy, Tom Petch, Valery Smyslov, and Wang Haiguang.
