Common YANG Data Types for Cryptography
draft-ietf-netconf-crypto-types-04

Abstract

This document defines YANG identities, typedefs, the groupings useful for cryptographic applications.

Editorial Note (To be removed by RFC Editor)

This draft contains many placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

o "XXXX" --> the assigned RFC value for this draft

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

o "2019-03-09" --> the publication date of this draft

The following Appendix section is to be removed prior to publication:

o Appendix B. Change Log

Status of This Memo

Table of Contents

1. Introduction

This document defines a YANG 1.1 [RFC7950] module specifying identities, typedefs, and groupings useful for cryptography.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

2. The Crypto Types Module

2.1. Tree Diagram

This section provides a tree diagram [RFC8340] for the "ietf-crypto-types" module. Only the groupings as represented, as tree diagrams have no means to represent identities or typedefs.

```
module: ietf-crypto-types

  grouping public-key-grouping:
    +---- algorithm?    asymmetric-key-algorithm-ref
    +---- public-key?   binary
  grouping asymmetric-key-pair-grouping:
    +---- algorithm?            asymmetric-key-algorithm-ref
    +---- public-key?           binary
    +---- private-key?          union
    +---x generate-hidden-key
    |  +---- input
    |     +---w algorithm    asymmetric-key-algorithm-ref
    +---x install-hidden-key
       +---- input
          +---w algorithm      asymmetric-key-algorithm-ref
          +---w public-key?    binary
          +---w private-key?   binary
  grouping trust-anchor-cert-grouping:
    +---- cert?                     trust-anchor-cert-cms
    +---n certificate-expiration
       +--ro expiration-date    ietf-yang-types:date-and-time
  grouping end-entity-cert-grouping:
    +---- cert?                     end-entity-cert-cms
    +---n certificate-expiration
       +--ro expiration-date    ietf-yang-types:date-and-time
  grouping asymmetric-key-pair-with-certs-grouping:
    +---- algorithm?
    |       asymmetric-key-algorithm-ref
    +---- public-key?                            binary
```

```
       +---- private-key?                          union
       +---x generate-hidden-key
       |  +---- input
       |     +---w algorithm    asymmetric-key-algorithm-ref
       +---x install-hidden-key
       |  +---- input
       |     +---w algorithm      asymmetric-key-algorithm-ref
       |     +---w public-key?    binary
       |     +---w private-key?   binary
       +---- certificates
       |  +---- certificate* [name]
       |     +---- name                     string
       |     +---- cert?                    end-entity-cert-cms

   }

   <CODE ENDS>
```

3. Security Considerations

In order to use YANG identities for algorithm identifiers, only the most commonly used RSA key lengths are supported for the RSA algorithm. Additional key lengths can be defined in another module or added into a future version of this document.

This document limits the number of elliptical curves supported. This was done to match industry trends and IETF best practice (e.g., matching work being done in TLS 1.3). If additional algorithms are needed, they can be defined by another module or added into a future version of this document.

Some of the operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

generate-certificate-signing-request: For this action, it is RECOMMENDED that implementations assert channel binding [RFC5056], so as to ensure that the application layer that sent the request is the same as the device authenticated when the secure transport layer was established.

This document uses PKCS #10 [RFC2986] for the "generate-certificate-signing-request" action. The use of Certificate Request Message Format (CRMF) [RFC4211] was considered, but is was unclear if there was market demand for it. If it is desired to support CRMF in the future, placing a "choice" statement in both the input and output

statements, along with an "if-feature" statement on the CRMF option, would enable a backwards compatible solution.

NACM:default-deny-all is set on asymmetric-key-pair-grouping's "private-key" node, as private keys should never be revealed without explicit permission.

4. IANA Considerations

4.1. The IETF XML Registry

This document registers one URI in the "ns" subregistry of the IETF XML Registry [RFC3688]. Following the format in [RFC3688], the following registration is requested:

```
URI: urn:ietf:params:xml:ns:yang:ietf-crypto-types
Registrant Contact: The NETCONF WG of the IETF.
XML: N/A, the requested URI is an XML namespace.
```

4.2. The YANG Module Names Registry

This document registers one YANG module in the YANG Module Names registry [RFC6020]. Following the format in [RFC6020], the the following registration is requested:

```
name:         ietf-crypto-types
namespace:    urn:ietf:params:xml:ns:yang:ietf-crypto-types
prefix:       ct
reference:    RFC XXXX
```

Appendix A. Examples

A.1. The "asymmetric-key-pair-with-certs-grouping" Grouping

The following example module has been constructed to illustrate use of the "asymmetric-key-pair-with-certs-grouping" grouping defined in the "ietf-crypto-types" module.

Note that the "asymmetric-key-pair-with-certs-grouping" grouping uses both the "asymmetric-key-pair-grouping" and "end-entity-cert-grouping" groupings, and that the "asymmetric-key-pair-grouping" grouping uses the "public-key-grouping" grouping. Thus, a total of four of the five groupings defined in the "ietf-crypto-types" module are illustrated through the use of this one grouping. The only grouping not represented is the "trust-anchor-cert-grouping" grouping.

```
module ex-crypto-types-usage {
  yang-version 1.1;

  namespace "http://example.com/ns/example-crypto-types-usage";
  prefix "ectu";

  import ietf-crypto-types {
    prefix ct;
    reference
      "RFC XXXX: Common YANG Data Types for Cryptography";
  }

  organization
   "Example Corporation";

  contact
   "Author: YANG Designer <mailto:yang.designer@example.com>";

  description
   "This module illustrates the grouping
    defined in the crypto-types draft called
    'asymmetric-key-pair-with-certs-grouping'.";

  revision "1001-01-01" {
    description
     "Initial version";
    reference
     "RFC ????: Usage Example for RFC XXXX";
  }

  container keys {
    description
      "A container of keys.";
    list key {
      key name;
      leaf name {
        type string;
        description
          "An arbitrary name for this key.";
      }
      uses ct:asymmetric-key-pair-with-certs-grouping;
      description
        "An asymmetric key pair with associated certificates.";
    }
  }
}
```

Given the above example usage module, the following example illustrates some configured keys.

```
<keys xmlns="http://example.com/ns/example-crypto-types-usage">
  <key>
    <name>ex-key</name>
    <algorithm
      xmlns:ct="urn:ietf:params:xml:ns:yang:ietf-crypto-types">
      ct:rsa2048
    </algorithm>
    <private-key>base64encodedvalue==</private-key>
    <public-key>base64encodedvalue==</public-key>
    <certificates>
      <certificate>
        <name>ex-cert</name>
        <cert>base64encodedvalue==</cert>
      </certificate>
    </certificates>
  </key>
</keys>
```

A.2. The "generate-hidden-key" Action

The following example illustrates the "generate-hidden-key" action in use with the NETCONF protocol.

REQUEST

```
<rpc message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <action xmlns="urn:ietf:params:xml:ns:yang:1">
    <keys xmlns="http://example.com/ns/example-crypto-types-usage">
      <key>
        <name>empty-key</name>
        <generate-hidden-key>
          <algorithm
           xmlns:ct="urn:ietf:params:xml:ns:yang:ietf-crypto-types">
              ct:rsa2048
          </algorithm>
        </generate-hidden-key>
      </key>
    </keys>
  </action>
</rpc>
```

RESPONSE

```
<rpc-reply message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ok/>
</rpc-reply>
```

A.3. The "install-hidden-key" Action

The following example illustrates the "install-hidden-key" action in use with the NETCONF protocol.

REQUEST

```
<rpc message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <action xmlns="urn:ietf:params:xml:ns:yang:1">
    <keys xmlns="http://example.com/ns/example-crypto-types-usage">
      <key>
        <name>empty-key</name>
        <install-hidden-key>
          <algorithm
           xmlns:ct="urn:ietf:params:xml:ns:yang:ietf-crypto-types">
              ct:rsa2048
          </algorithm>
          <public-key>base64encodedvalue==</public-key>
          <private-key>base64encodedvalue==</private-key>
        </install-hidden-key>
      </key>
    </keys>
  </action>
</rpc>
```

RESPONSE

```
<rpc-reply message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ok/>
</rpc-reply>
```

A.4. The "generate-certificate-signing-request" Action

The following example illustrates the "generate-certificate-signing-request" action in use with the NETCONF protocol.

```
REQUEST

<rpc message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <action xmlns="urn:ietf:params:xml:ns:yang:1">
    <keys xmlns="http://example.com/ns/example-crypto-types-usage">
      <key>
        <name>ex-key-sect571r1</name>
        <generate-certificate-signing-request>
          <subject>base64encodedvalue==</subject>
          <attributes>base64encodedvalue==</attributes>
        </generate-certificate-signing-request>
      </key>
    </keys>
  </action>
</rpc>

RESPONSE

<rpc-reply message-id="101"
   xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
   <certificate-signing-request
     xmlns="http://example.com/ns/example-crypto-types-usage">
     base64encodedvalue==
   </certificate-signing-request>
</rpc-reply>
```

A.5. The "certificate-expiration" Notification

The following example illustrates the "certificate-expiration" notification in use with the NETCONF protocol.

```
<notification
  xmlns="urn:ietf:params:xml:ns:netconf:notification:1.0">
  <eventTime>2018-05-25T00:01:00Z</eventTime>
  <keys xmlns="http://example.com/ns/example-crypto-types-usage">
    <key>
      <name>locally-defined key</name>
      <certificates>
        <certificate>

Appendix B. Change Log

B.1. I-D to 00

- o Removed groupings and notifications.
- o Added typedefs for identityrefs.
- o Added typedefs for other RFC 5280 structures.
- o Added typedefs for other RFC 5652 structures.
- o Added convenience typedefs for RFC 4253, RFC 5280, and RFC 5652.

B.2. 00 to 01

- o Moved groupings from the draft-ietf-netconf-keystore here.

B.3. 01 to 02

- o Removed unwanted "mandatory" and "must" statements.
- o Added many new crypto algorithms (thanks Haiguang!)
- o Clarified in asymmetric-key-pair-with-certs-grouping, in certificates/certificate/name/description, that if the name MUST NOT match the name of a certificate that exists independently in

<operational>, enabling certs installed by the manufacturer (e.g., an IDevID).

B.4. 02 to 03

- renamed base identity 'asymmetric-key-encryption-algorithm' to 'asymmetric-key-algorithm'.

- added new 'asymmetric-key-algorithm' identities for secp192r1, secp224r1, secp256r1, secp384r1, and secp521r1.

- removed 'mac-algorithm' identities for mac-aes-128-ccm, mac-aes-192-ccm, mac-aes-256-ccm, mac-aes-128-gcm, mac-aes-192-gcm, mac-aes-256-gcm, and mac-chacha20-poly1305.

- for all -cbc and -ctr identities, renamed base identity 'symmetric-key-encryption-algorithm' to 'encryption-algorithm'.

- for all -ccm and -gcm identities, renamed base identity 'symmetric-key-encryption-algorithm' to 'encryption-and-mac-algorithm' and renamed the identity to remove the "enc-" prefix.

- for all the 'signature-algorithm' based identities, renamed from 'rsa-*' to 'rsassa-*'.

- removed all of the "x509v3-" prefixed 'signature-algorithm' based identities.

- added 'key-exchange-algorithm' based identities for 'rsaes-oaep' and 'rsaes-pkcs1-v1_5'.

- renamed typedef 'symmetric-key-encryption-algorithm-ref' to 'symmetric-key-algorithm-ref'.

- renamed typedef 'asymmetric-key-encryption-algorithm-ref' to 'asymmetric-key-algorithm-ref'.

- added typedef 'encryption-and-mac-algorithm-ref'.

- Updated copyright date, boilerplate template, affiliation, and folding algorithm.

B.5. 03 to 04

- ran YANG module through formatter.

Acknowledgements

The authors would like to thank for following for lively discussions on list and in the halls (ordered by last name): Martin Bjorklund, Balazs Kovacs, Eric Voit, and Liang Xia.
