Common YANG Data Types for Cryptography
draft-ietf-netconf-crypto-types-06

Abstract

This document defines YANG identities, typedefs, the groupings useful for cryptographic applications.

Editorial Note (To be removed by RFC Editor)

This draft contains many placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

- o "XXXX" --> the assigned RFC value for this draft

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

- o "2019-04-29" --> the publication date of this draft

The following Appendix section is to be removed prior to publication:

- o [Appendix B](#). Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any

time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on October 31, 2019.

[1.](#) Introduction

This document defines a YANG 1.1 [[RFC7950](#)] module specifying identities, typedefs, and groupings useful for cryptography.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

[2.](#) The Crypto Types Module

[2.1.](#) Tree Diagram

This section provides a tree diagram [[RFC8340](#)] for the "ietf-crypto-types" module. Only the groupings as represented, as tree diagrams have no means to represent identities or typedefs.

```
module: ietf-crypto-types
```

```

grouping public-key-grouping:
  +---- algorithm?    asymmetric-key-algorithm-ref
  +---- public-key?  binary
grouping asymmetric-key-pair-grouping:
  +---- algorithm?    asymmetric-key-algorithm-ref
  +---- public-key?  binary
  +---- private-key? union
  +---x generate-hidden-key
    | +---- input
    |   +---w algorithm    asymmetric-key-algorithm-ref

```

```

+---x install-hidden-key
  +---- input
    +---w algorithm      asymmetric-key-algorithm-ref
    +---w public-key?    binary
    +---w private-key?   binary
grouping trust-anchor-cert-grouping:
+---- cert?              trust-anchor-cert-cms
+---n certificate-expiration

typedef trust-anchor-cert-cms {
  type signed-data-cms;
  description
    "A CMS SignedData structure that MUST contain the chain of
    X.509 certificates needed to authenticate the certificate
```

presented by a client or end-entity.

The CMS MUST contain only a single chain of certificates. The client or end-entity certificate MUST only authenticate to last intermediate CA certificate listed in the chain.

In all cases, the chain MUST include a self-signed root certificate. In the case where the root certificate is itself the issuer of the client or end-entity certificate, only one certificate is present.

This CMS structure MAY (as applicable where this type is used) also contain suitably fresh (as defined by local policy) revocation objects with which the device can verify the revocation status of the certificates.

This CMS encodes the degenerate form of the SignedData structure that is commonly used to disseminate X.509 certificates and revocation objects ([RFC 5280](#)).";

<CODE ENDS>
```

[3.](#) Security Considerations

[3.1.](#) Support for Algorithms

In order to use YANG identities for algorithm identifiers, only the most commonly used RSA key lengths are supported for the RSA algorithm. Additional key lengths can be defined in another module or added into a future version of this document.

This document limits the number of elliptical curves supported. This was done to match industry trends and IETF best practice (e.g., matching work being done in TLS 1.3). If additional algorithms are needed, they can be defined by another module or added into a future version of this document.

[3.2.](#) No Support for CRMF

This document uses PKCS #10 [[RFC2986](#)] for the "generate-certificate-signing-request" action. The use of Certificate Request Message Format (CRMF) [[RFC4211](#)] was considered, but it was unclear if there was market demand for it. If it is desired to support CRMF in the future, a backwards compatible solution can be defined at that time.

[3.3.](#) Access to Data Nodes

The YANG module in this document defines "grouping" statements that

are designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC8341](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

There are a number of data nodes defined by the grouping statements that are writable/creatable/deletable (i.e., config true, which is the default). Some of these data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

- *: All of the data nodes defined by all the groupings are considered sensitive to write operations. For instance, the modification of a public key or a certificate can dramatically alter the implemented security policy. For this reason, the NACM extension "default-deny-write" has been applied to all the data nodes defined by all the groupings.

Some of the readable data nodes in the YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

- /private-key: The "private-key" node defined in the "asymmetric-key-pair-grouping" grouping is additionally sensitive to read operations such that, in normal use cases, it should never be

returned to a client. For this reason, the NACM extension "default-deny-all" has been applied to it here.

Some of the operations in this YANG module may be considered

sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

*: All of the "action" statements defined by groupings SHOULD only be executed by authorized users. For this reason, the NACM extension "default-deny-all" has been applied to all of them. Note that NACM uses "default-deny-all" to protect "RPC" and "action" statements; it does not define, e.g., an extension called "default-deny-execute".

generate-certificate-signing-request: For this action, it is RECOMMENDED that implementations assert channel binding [[RFC5056](#)], so as to ensure that the application layer that sent the request is the same as the device authenticated when the secure transport layer was established.

[4.](#) IANA Considerations

[4.1.](#) The IETF XML Registry

This document registers one URI in the "ns" subregistry of the IETF XML Registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration is requested:

URI: urn:ietf:params:xml:ns:yang:ietf-crypto-types
Registrant Contact: The NETCONF WG of the IETF.
XML: N/A, the requested URI is an XML namespace.

[4.2.](#) The YANG Module Names Registry

This document registers one YANG module in the YANG Module Names registry [[RFC6020](#)]. Following the format in [[RFC6020](#)], the the following registration is requested:

name: ietf-crypto-types
namespace: urn:ietf:params:xml:ns:yang:ietf-crypto-types
prefix: ct
reference: RFC XXXX

[Appendix A](#). Examples

[A.1](#). The "asymmetric-key-pair-with-certs-grouping" Grouping

The following example module has been constructed to illustrate use of the "asymmetric-key-pair-with-certs-grouping" grouping defined in the "ietf-crypto-types" module.

Note that the "asymmetric-key-pair-with-certs-grouping" grouping uses both the "asymmetric-key-pair-grouping" and "end-entity-cert-grouping" groupings, and that the "asymmetric-key-pair-grouping" grouping uses the "public-key-grouping" grouping. Thus, a total of

four of the five groupings defined in the "ietf-crypto-types" module are illustrated through the use of this one grouping. The only grouping not represented is the "trust-anchor-cert-grouping" grouping.

```
module ex-crypto-types-usage {  
  yang-version 1.1;  
  
  namespace "http://example.com/ns/example-crypto-types-usage";  
  prefix "ectu";
```

```

import ietf-crypto-types {
  prefix ct;
  reference
    "RFC XXXX: Common YANG Data Types for Cryptography";
}

organization
  "Example Corporation";

contact
  "Author: YANG Designer <mailto:yang.designer@example.com>";

description
  "This module illustrates the grouping
  defined in the crypto-types draft called
  'asymmetric-key-pair-with-certs-grouping'.";

revision "1001-01-01" {
  description
    "Initial version";
  reference
    "RFC ????: Usage Example for RFC XXXX";
}

container keys {
  description
    "A container of keys.";
  list key {
    key name;
    leaf name {
      type string;
      description
        "An arbitrary name for this key.";
    }
  }
  uses ct:asymmetric-key-pair-with-certs-grouping;
  description
    "An asymmetric key pair with associated certificates.";
}
}
}

```

Given the above example usage module, the following example illustrates some configured keys.

```
<keys xmlns="http://example.com/ns/example-crypto-types-usage">
  <key>
    <name>ex-key</name>
    <algorithm
      xmlns:ct="urn:ietf:params:xml:ns:yang:ietf-crypto-types"
      ct:rsa2048
    </algorithm>
    <private-key>base64encodedvalue==</private-key>
    <public-key>base64encodedvalue==</public-key>
    <certificates>
      <certificate>
        <name>ex-cert</name>
        <cert>base64encodedvalue==</cert>
      </certificate>
    </certificates>
  </key>
</keys>
```

[A.2.](#) The "generate-hidden-key" Action

The following example illustrates the "generate-hidden-key" action in use with the NETCONF protocol.

REQUEST

```
<rpc message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <action xmlns="urn:ietf:params:xml:ns:yang:1">
    <keys xmlns="http://example.com/ns/example-crypto-types-usage">
      <key>
        <name>empty-key</name>
        <generate-hidden-key>
          <algorithm
            xmlns:ct="urn:ietf:params:xml:ns:yang:ietf-crypto-types"
            ct:rsa2048
          </algorithm>
        </generate-hidden-key>
      </key>
    </keys>
  </action>
</rpc>
```

RESPONSE

```
<rpc-reply message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ok/>
</rpc-reply>
```

[A.3.](#) The "install-hidden-key" Action

The following example illustrates the "install-hidden-key" action in use with the NETCONF protocol.

REQUEST

```
<rpc message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <action xmlns="urn:ietf:params:xml:ns:yang:1">
    <keys xmlns="http://example.com/ns/example-crypto-types-usage">
      <key>
        <name>empty-key</name>
        <install-hidden-key>
          <algorithm
            xmlns:ct="urn:ietf:params:xml:ns:yang:ietf-crypto-types">
            ct:rsa2048
          </algorithm>
          <public-key>base64encodedvalue==</public-key>
          <private-key>base64encodedvalue==</private-key>
        </install-hidden-key>
      </key>
    </keys>
  </action>
</rpc>
```

RESPONSE

```
<rpc-reply message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ok/>
</rpc-reply>
```

[A.4.](#) The "generate-certificate-signing-request" Action

The following example illustrates the "generate-certificate-signing-request" action in use with the NETCONF protocol.

REQUEST

```
<rpc message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <action xmlns="urn:ietf:params:xml:ns:yang:1">
    <keys xmlns="http://example.com/ns/example-crypto-types-usage">
      <key>
        <name>ex-key-sect571r1</name>
        <generate-certificate-signing-request>
          <subject>base64encodedvalue==</subject>
          <attributes>base64encodedvalue==</attributes>
        </generate-certificate-signing-request>
      </key>
    </keys>
  </action>
</rpc>
```

RESPONSE

```
<rpc-reply message-id="101"
  xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <certificate-signing-request
    xmlns="http://example.com/ns/example-crypto-types-usage">
    base64encodedvalue==
  </certificate-signing-request>
</rpc-reply>
```

[A.5.](#) The "certificate-expiration" Notification

The following example illustrates the "certificate-expiration" notification in use with the NETCONF protocol.

```
<notification
  xmlns="urn:ietf:params:xml:ns:netconf:notification:1.0">
  <eventTime>2018-05-25T00:01:00Z</eventTime>
  <keys xmlns="http://example.com/ns/example-crypto-types-usage">
    <key>
      <name>locally-defined key</name>
      <certificates>
        <certificate>
          <name>my-cert</name>
          <certificate-expiration>
            <expiration-date>
              2018-08-05T14:18:53-05:00
            </expiration-date>
          </certificate-expiration>
        </certificate>
      </certificates>
    </key>
  </keys>
</notification>
```

[Appendix B](#). Change Log

[B.1](#). I-D to 00

- o Removed groupings and notifications.
- o Added typedefs for identityrefs.

- o Added typedefs for other [RFC 5280](#) structures.
- o Added typedefs for other [RFC 5652](#) structures.
- o Added convenience typedefs for [RFC 4253](#), [RFC 5280](#), and [RFC 5652](#).

[B.2.](#) 00 to 01

- o Moved groupings from the [draft-ietf-netconf-keystore](#) here.

[B.3.](#) 01 to 02

- o Removed unwanted "mandatory" and "must" statements.
- o Added many new crypto algorithms (thanks Haiguang!)
- o Clarified in asymmetric-key-pair-with-certs-grouping, in certificates/certificate/name/description, that if the name MUST NOT match the name of a certificate that exists independently in

<operational>, enabling certs installed by the manufacturer (e.g., an IDevID).

[B.4.](#) 02 to 03

- o renamed base identity 'asymmetric-key-encryption-algorithm' to 'asymmetric-key-algorithm'.
- o added new 'asymmetric-key-algorithm' identities for secp192r1, secp224r1, secp256r1, secp384r1, and secp521r1.
- o removed 'mac-algorithm' identities for mac-aes-128-ccm, mac-aes-192-ccm, mac-aes-256-ccm, mac-aes-128-gcm, mac-aes-192-gcm, mac-aes-256-gcm, and mac-chacha20-poly1305.
- o for all -cbc and -ctr identities, renamed base identity 'symmetric-key-encryption-algorithm' to 'encryption-algorithm'.
- o for all -ccm and -gcm identities, renamed base identity 'symmetric-key-encryption-algorithm' to 'encryption-and-mac-algorithm' and renamed the identity to remove the "enc-" prefix.

- o for all the 'signature-algorithm' based identities, renamed from 'rsa-*' to 'rsassa-*'.
- o removed all of the "x509v3-" prefixed 'signature-algorithm' based identities.
- o added 'key-exchange-algorithm' based identities for 'rsaes-oaep' and 'rsaes-pkcs1-v1_5'.
- o renamed typedef 'symmetric-key-encryption-algorithm-ref' to 'symmetric-key-algorithm-ref'.
- o renamed typedef 'asymmetric-key-encryption-algorithm-ref' to 'asymmetric-key-algorithm-ref'.
- o added typedef 'encryption-and-mac-algorithm-ref'.
- o Updated copyright date, boilerplate template, affiliation, and folding algorithm.

[B.5.](#) 03 to 04

- o ran YANG module through formatter.

[B.6.](#) 04 to 05

- o fixed broken symlink causing reformatted YANG module to not show.

[B.7.](#) 05 to 06

- o Added NACM annotations.
- o Updated Security Considerations section.
- o Added 'asymmetric-key-pair-with-cert-grouping' grouping.
- o Removed text from 'permanently-hidden' enum regarding such keys not being backed up or restored.

- o Updated the boilerplate text in module-level "description" statement to match copyeditor convention.
- o Added an explanation to the 'public-key-grouping' and 'asymmetric-key-pair-grouping' statements as for why the nodes are not mandatory (e.g., because they may exist only in <operational>).
- o Added 'must' expressions to the 'public-key-grouping' and 'asymmetric-key-pair-grouping' statements ensuring sibling nodes are either all exist or do not all exist.
- o Added an explanation to the 'permanently-hidden' that the value cannot be configured directly by clients and servers MUST fail any attempt to do so.
- o Added 'trust-anchor-certs-grouping' and 'end-entity-certs-grouping' (the plural form of existing groupings).
- o Now states that keys created in <operational> by the *-hidden-key actions are bound to the lifetime of the parent 'config true' node, and that subsequent invocations of either action results in a failure.

Acknowledgements

The authors would like to thank for following for lively discussions on list and in the halls (ordered by last name): Martin Bjorklund, Balazs Kovacs, Juergen Schoenwaelder, Eric Voit, and Liang Xia.
