Abstract

This document defines YANG identities, typedefs, the groupings useful for cryptographic applications.

Editorial Note (To be removed by RFC Editor)

This draft contains many placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

- "XXXX" --> the assigned RFC value for this draft

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

- "2019-06-07" --> the publication date of this draft

The following Appendix section is to be removed prior to publication:

- Appendix B. Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any
time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on December 9, 2019.

1. Introduction

This document defines a YANG 1.1 [RFC7950] module specifying identities, typedefs, and groupings useful for cryptography.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

2. The Crypto Types Module

2.1. Tree Diagram

This section provides a tree diagram [RFC8340] for the "ietf-crypto-types" module. Only the groupings as represented, as tree diagrams have no means to represent identities or typedefs.

module: ietf-crypto-types

grouping public-key-grouping:
    ++++ algorithm asymmetric-key-algorithm-ref
    ++++ public-key binary

grouping asymmetric-key-pair-grouping:
    ++++ algorithm asymmetric-key-algorithm-ref
    ++++ public-key binary
    ++++ private-key union

grouping trust-anchor-cert-grouping:
    ++++ cert? trust-anchor-cert-cms
    +++-n certificate-expiration
    +++-ro expiration-date ietf-yang-types:date-and-time
grouping trust-anchor-certs-grouping:
  +---- cert*                    trust-anchor-cert-cms
  +---- n certificate-expiration
    +--ro expiration-date    ietf-yang-types:date-and-time

grouping end-entity-cert-grouping:
  +---- cert?                    end-entity-cert-cms
  +---- n certificate-expiration
    +--ro expiration-date    ietf-yang-types:date-and-time

grouping end-entity-certs-grouping:
  +---- cert*                    end-entity-cert-cms
  +---- n certificate-expiration
    +--ro expiration-date    ietf-yang-types:date-and-time

---

Watsen & Wang           Expires December 9, 2019                [Page 3]

Internet-Draft   Common YANG Data Types for Cryptography       June 2019

---

grouping asymmetric-key-pair-with-cert-grouping:
  +---- algorithm
    |   asymmetric-key-algorithm-ref
  +---- public-key                             binary
  +---- private-key                            union
  +---- cert?                                  end-entity-cert-cms
  +---- n certificate-expiration
    +--ro expiration-date    ietf-yang-types:date-and-time
  +---x generate-certificate-signing-request
    +---- input
    |   +----w subject       binary
    |   +----w attributes?   binary
    +---- output
    +--ro certificate-signing-request    binary

grouping asymmetric-key-pair-with-certs-grouping:
  +---- algorithm
    |   asymmetric-key-algorithm-ref
  +---- public-key                             binary
  +---- private-key                            union
  +---- certificates
    |   +---- certificate* [name]
    |   |   +---- name                     string
    |   |   +---- cert?                    end-entity-cert-cms
    |   |   +---- n certificate-expiration
    |   |   |   +--ro expiration-date    ietf-yang-types:date-and-time
    |   +---x generate-certificate-signing-request
    |         +---- input
    |         |   +----w subject       binary
    |         |   +----w attributes?   binary
2.2. YANG Module

This module has normative references to [RFC2404], [RFC3565], [RFC3686], [RFC4106], [RFC4253], [RFC4279], [RFC4309], [RFC4494], [RFC4543], [RFC4868], [RFC5280], [RFC5652], [RFC5656], [RFC6187], [RFC6991], [RFC7919], [RFC8268], [RFC8332], [RFC8341], [RFC8422], [RFC8446], and [ITU.X690.2015].

This module has an informational reference to [RFC2986], [RFC3174], [RFC4493], [RFC5915], [RFC6125], [RFC6234], [RFC6239], [RFC6507], [RFC8017], [RFC8032], [RFC8439].

| nacm:default-deny-write; |
type binary;
mandatory true;
description
"The binary value of the public key. The interpretation of
the value is defined by 'algorithm'. For example, a DSA
key is an integer, an RSA key is represented as RSAPublicKey
per RFC 8017, and an ECC key is represented using the
'publicKey' described in RFC 5915."
reference
"RFC 8017: Public-Key Cryptography Standards (PKCS) #1:
RSA Cryptography Specifications Version 2.2.
RFC 5915: Elliptic Curve Private Key Structure.";
}
}

grouping asymmetric-key-pair-grouping {

description
"A private key and its associated public key and algorithm.";
uses public-key-grouping;

leaf private-key {
	nacm:default-deny-all;

type union {

type binary;

type string {

pattern
'permanently-hidden'
+ 'encrypted-by:.*:[A-Za-z0-9+/][=]{1,3}'
+ 'value-to-be-generated(-and-hidden)\?'
+ 'value-to-be-hidden:[A-Za-z0-9+/]+[=]{1,3}';
}

mandatory true;

description
"Either the binary value of the private key or a value
indentifying special input and output values described
below. The key's value is interpreted by the 'algorithm'.
For example, a DSA key is an integer, an RSA key is
represented as RSAPrivateKey as defined in RFC 8017, and
an ECC key is represented as ECPrivateKey as defined in
RFC 5915.";
Special input and output values:

permanently-hidden

Primarily an output value indicating that the private key value is not available in any form. The only time this value MAY be used as an input value is when it is being used to copy a manufacturer-generated value from <operational> to <running>.

encrypted-by:*:[A-Za-z0-9+/]+[=]{1,3}

Primarily an output value indicating that the private key is encrypted using another key, identified by the 'by' attribute. The only time this value MAY be used as a input value is when it is being used to copy a manufacturer-generated value from <operational> to <running>. Following the prefix is the base64-encoded value of the encrypted private key.

value-to-be-generated(-and-hidden)?

An input value used to request the system to generate, and optionally hide, the public/private key pair. When used, the 'public-key' value MUST be empty (zero bytes).

Without the optional '-and-hidden' postfix, the generated key pair is stored in the configuration data store as if the values had been configured by the client.

With the optional '-and-hidden' postfix, the generated key pair is 'hidden' and thereafter be reported using either 'permanently-hidden' or 'encrypted-by:*:'.

The server's support for 'value-to-be-generated' input value is known by the 'generate-key' feature, and the server's support for 'value-to-be-generated-and-hidden' value is known by the combination of both the 'generate-key' and 'hidden-key' features.

value-to-be-hidden:[A-Za-z0-9+/]+[=]{1,3}
An input value used to request the system to store the provided private key such that it will thereafter be reported using either as 'permanently-hidden' or 'encrypted-by:*:'. Following the prefix is the base64-encoded value of the private key.

The server's support for 'value-to-be-hidden' input value is known by the 'hidden-key' feature.

3. Security Considerations

3.1. Support for Algorithms

In order to use YANG identities for algorithm identifiers, only the most commonly used RSA key lengths are supported for the RSA algorithm. Additional key lengths can be defined in another module or added into a future version of this document.

This document limits the number of elliptical curves supported. This was done to match industry trends and IETF best practice (e.g., matching work being done in TLS 1.3). If additional algorithms are needed, they can be defined by another module or added into a future version of this document.

3.2. No Support for CRMF

This document uses PKCS #10 [RFC2986] for the "generate-certificate-signing-request" action. The use of Certificate Request Message Format (CRMF) [RFC4211] was considered, but it was unclear if there
was market demand for it. If it is desired to support CRMF in the future, a backwards compatible solution can be defined at that time.

3.3. Access to Data Nodes

The YANG module in this document defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [RFC6241] and RESTCONF [RFC8040]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [RFC8341] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

There are a number of data nodes defined by the grouping statements that are writable/creatable/deletable (i.e., config true, which is the default). Some of these data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

*: All of the data nodes defined by all the groupings are considered sensitive to write operations. For instance, the modification of a public key or a certificate can dramatically alter the implemented security policy. For this reason, the NACM extension "default-deny-write" has been applied to all the data nodes defined by all the groupings.

Some of the readable data nodes in the YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

/private-key: The "private-key" node defined in the "asymmetric-
key-pair-grouping" grouping is additionally sensitive to read operations such that, in normal use cases, it should never be returned to a client. For this reason, the NACM extension "default-deny-all" has been applied to it here.

Some of the operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

*: All of the "action" statements defined by groupings SHOULD only be executed by authorized users. For this reason, the NACM extension "default-deny-all" has been applied to all of them. Note that NACM uses "default-deny-all" to protect "RPC" and "action" statements; it does not define, e.g., an extension called "default-deny-execute".

generate-certificate-signing-request: For this action, it is RECOMMENDED that implementations assert channel binding [RFC5056], so as to ensure that the application layer that sent the request is the same as the device authenticated when the secure transport layer was established.

4. IANA Considerations

4.1. The IETF XML Registry

This document registers one URI in the "ns" subregistry of the IETF XML Registry [RFC3688]. Following the format in [RFC3688], the following registration is requested:

Registrant Contact: The NETCONF WG of the IETF.
XML: N/A, the requested URI is an XML namespace.

4.2. The YANG Module Names Registry

This document registers one YANG module in the YANG Module Names registry [RFC6020]. Following the format in [RFC6020], the the
following registration is requested:

name:         ietf-crypto-types
prefix:       ct
reference:    RFC XXXX

Appendix A. Examples

A.1. The "asymmetric-key-pair-with-certs-grouping" Grouping

The following example module has been constructed to illustrate use of the "asymmetric-key-pair-with-certs-grouping" grouping defined in the "ietf-crypto-types" module.

Note that the "asymmetric-key-pair-with-certs-grouping" grouping uses both the "asymmetric-key-pair-grouping" and "end-entity-cert-grouping" groupings, and that the "asymmetric-key-pair-grouping" grouping uses the "public-key-grouping" grouping. Thus, a total of four of the five groupings defined in the "ietf-crypto-types" module are illustrated through the use of this one grouping. The only grouping not represented is the "trust-anchor-cert-grouping" grouping.
module ex-crypto-types-usage {
  yang-version 1.1;

  namespace "http://example.com/ns/example-crypto-types-usage";
  prefix "ectu";

  import ietf-crypto-types {
    prefix ct;
    reference
      "RFC XXXX: Common YANG Data Types for Cryptography";
  }
}
organization
"Example Corporation";

contact
"Author: YANG Designer <mailto:yang.designer@example.com>";

description
"This module illustrates the grouping
defined in the crypto-types draft called
'asymmetric-key-pair-with-certs-grouping'."

revision "1001-01-01" {
    description
    "Initial version";
    reference
    "RFC ?????: Usage Example for RFC XXXX";
}

container keys {
    description
    "A container of keys.";
    list key {
        key name;
        leaf name {
            type string;
            description
            "An arbitrary name for this key.";
        }
        uses ct:asymmetric-key-pair-with-certs-grouping;
        description
        "An asymmetric key pair with associated certificates.";
    }
}

Given the above example usage module, the following example
illustrates some configured keys.
<keys xmlns="http://example.com/ns/example-crypto-types-usage">
  <key>
    <name>ex-key</name>
    <algorithm
      ct:rsa2048
    </algorithm>
    <public-key>base64encodedvalue==</public-key>
    <private-key>base64encodedvalue==</private-key>
    <certificates>
      <certificate>
        <name>ex-cert</name>
        <cert>base64encodedvalue==</cert>
      </certificate>
    </certificates>
  </key>
  <key>
    <name>ex-hidden-key</name>
    <algorithm
      ct:rsa2048
    </algorithm>
    <public-key>base64encodedvalue==</public-key>
    <private-key>permanently-hidden</private-key>
    <certificates>
      <certificate>
        <name>ex-hidden-key-cert</name>
        <cert>base64encodedvalue==</cert>
      </certificate>
    </certificates>
  </key>
  <key>
    <name>ex-encrypted-key</name>
    <algorithm
      ct:rsa2048
    </algorithm>
    <public-key>base64encodedvalue==</public-key>
    <private-key>encrypted-by:ex-key:base64encodedvalue==</private-key>
    <certificates>
      <certificate>
        <name>ex-encrypted-key-cert</name>
        <cert>base64encodedvalue==</cert>
      </certificate>
    </certificates>
  </key>
</keys>
A.2. The "generate-certificate-signing-request" Action

The following example illustrates the "generate-certificate-signing-request" action in use with the NETCONF protocol.

REQUEST

```xml
<rpc message-id="101"
     xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <action xmlns="urn:ietf:params:xml:ns:yang:1">
    <keys xmlns="http://example.com/ns/example-crypto-types-usage">
      <key>
        <name>ex-key-sect571r1</name>
        <generate-certificate-signing-request>
          <subject>base64encodedvalue==</subject>
          <attributes>base64encodedvalue==</attributes>
        </generate-certificate-signing-request>
      </key>
    </keys>
  </action>
</rpc>
```

RESPONSE

```xml
<rpc-reply message-id="101"
            xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <certificate-signing-request
       xmlns="http://example.com/ns/example-crypto-types-usage">
    base64encodedvalue==
  </certificate-signing-request>
</rpc-reply>
```

A.3. The "certificate-expiration" Notification

The following example illustrates the "certificate-expiration" notification in use with the NETCONF protocol.
Appendix B. Change Log

B.1. I-D to 00

- Removed groupings and notifications.
- Added typedefs for identityrefs.
- Added typedefs for other RFC 5280 structures.
- Added typedefs for other RFC 5652 structures.
- Added convenience typedefs for RFC 4253, RFC 5280, and RFC 5652.

B.2. 00 to 01
Moved groupings from the `draft-ietf-netconf-keystore` here.

**B.3.** 01 to 02

- Removed unwanted "mandatory" and "must" statements.
- Added many new crypto algorithms (thanks Haiguang!)
- Clarified in asymmetric-key-pair-with-certs-grouping, in certificates/certificate/name/description, that if the name MUST NOT match the name of a certificate that exists independently in

<operational>, enabling certs installed by the manufacturer (e.g., an IDevID).

**B.4.** 02 to 03

- Renamed base identity 'asymmetric-key-encryption-algorithm' to 'asymmetric-key-algorithm'.
- Added new 'asymmetric-key-algorithm' identities for secp192r1, secp224r1, secp256r1, secp384r1, and secp521r1.
- For all -cbc and -ctr identities, renamed base identity 'symmetric-key-encryption-algorithm' to 'encryption-algorithm'.
- For all -ccm and -gcm identities, renamed base identity 'symmetric-key-encryption-algorithm' to 'encryption-and-mac-algorithm' and renamed the identity to remove the "enc-" prefix.
- For all the 'signature-algorithm' based identities, renamed from 'rsa-*' to 'rsassa-*'.
- Removed all of the "x509v3-" prefixed 'signature-algorithm' based identities.
o added 'key-exchange-algorithm' based identities for 'rsaes-oaep' and 'rsaes-pkcs1-v1_5'.

o renamed typedef 'symmetric-key-encryption-algorithm-ref' to 'symmetric-key-algorithm-ref'.

o renamed typedef 'asymmetric-key-encryption-algorithm-ref' to 'asymmetric-key-algorithm-ref'.

o added typedef 'encryption-and-mac-algorithm-ref'.

o Updated copyright date, boilerplate template, affiliation, and folding algorithm.

B.5. 03 to 04

o ran YANG module through formatter.

B.6. 04 to 05

o fixed broken symlink causing reformatted YANG module to not show.

B.7. 05 to 06

o Added NACM annotations.

o Updated Security Considerations section.

o Added 'asymmetric-key-pair-with-cert-grouping' grouping.

o Removed text from 'permanently-hidden' enum regarding such keys not being backed up or restored.

o Updated the boilerplate text in module-level "description" statement to match copyeditor convention.

o Added an explanation to the 'public-key-grouping' and 'asymmetric-key-pair-grouping' statements as for why the nodes are not mandatory (e.g., because they may exist only in <operational>).
- Added 'must' expressions to the 'public-key-grouping' and 'asymmetric-key-pair-grouping' statements ensuring sibling nodes are either all exist or do not all exist.

- Added an explanation to the 'permanently-hidden' that the value cannot be configured directly by clients and servers MUST fail any attempt to do so.

- Added 'trust-anchor-certs-grouping' and 'end-entity-certs-grouping' (the plural form of existing groupings).

- Now states that keys created in <operational> by the *-hidden-key actions are bound to the lifetime of the parent 'config true' node, and that subsequent invocations of either action results in a failure.

**B.8. 06 to 07**

- Added clarifications that implementations SHOULD assert that configured certificates contain the matching public key.

- Replaced the 'generate-hidden-key' and 'install-hidden-key' actions with special 'crypt-hash' -like input/output values.
