YANG Groupings for HTTP Clients and HTTP Servers

Abstract

This document defines two YANG modules: the first defines a minimal grouping for configuring an HTTP client, and the second defines a minimal grouping for configuring an HTTP server. It is intended that these groupings will be used to help define the configuration for simple HTTP-based protocols (not for complete web servers or browsers).

Editorial Note (To be removed by RFC Editor)

This draft contains placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements (note: not all may be present):

*AAAA --> the assigned RFC value for draft-ietf-netconf-crypto-types

*DDDD --> the assigned RFC value for draft-ietf-netconf-tcp-client-server

*FFFF --> the assigned RFC value for draft-ietf-netconf-tls-client-server

*GGGG --> the assigned RFC value for this draft

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

*2022-03-07 --> the publication date of this draft

The following Appendix section is to be removed prior to publication:

*[Appendix A](#). Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 8 September 2022.

1. Introduction

This document defines two YANG 1.1 [[RFC7950](#)] modules: the first defines a minimal grouping for configuring an HTTP client, and the second defines a minimal grouping for configuring an HTTP server. It is intended that these groupings will be used to help define the configuration for simple HTTP-based protocols (not for complete web servers or browsers).

1.1. Relation to other RFCs

This document presents one or more YANG modules [[RFC7950](#)] that are part of a collection of RFCs that work together to, ultimately, enable the configuration of the clients and servers of both the NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)] protocols.

The modules have been defined in a modular fashion to enable their use by other efforts, some of which are known to be in progress at the time of this writing, with many more expected to be defined in time.

The normative dependency relationship between the various RFCs in the collection is presented in the below diagram. The labels in the diagram represent the primary purpose provided by each RFC. Hyperlinks to each RFC are provided below the diagram.

Label in Diagram	Originating RFC
crypto-types	[I-D.ietf-netconf-crypto-types]
truststore	[I-D.ietf-netconf-trust-anchors]
keystore	[I-D.ietf-netconf-keystore]
tcp-client-server	[I-D.ietf-netconf-tcp-client-server]
ssh-client-server	[I-D.ietf-netconf-ssh-client-server]
tls-client-server	[I-D.ietf-netconf-tls-client-server]
http-client-server	[I-D.ietf-netconf-http-client-server]
netconf-client-server	[I-D.ietf-netconf-netconf-client-server]
restconf-client-server	[I-D.ietf-netconf-restconf-client-server]

Table 1: Label to RFC Mapping

1.2. Specification Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

1.3. Adherence to the NMDA

This document is compliant with the Network Management Datastore Architecture (NMDA) [[RFC8342](#)]. For instance, as described in [[I-](#)

[D.ietf-netconf-trust-anchors](#)] and [[I-D.ietf-netconf-keystore](#)], trust anchors and keys installed during manufacturing are expected to appear in <operational>.

1.4. Conventions

Various examples used in this document use a placeholder value for binary data that has been base64 encoded (e.g., "BASE64VALUE="). This placeholder value is used as real base64 encoded structures are often many lines long and hence distracting to the example being presented.

2. The "ietf-http-client" Module

This section defines a YANG 1.1 module called "ietf-http-client". A high-level overview of the module is provided in [Section 2.1](#). Examples illustrating the module's use are provided in [Examples \(Section 2.2\)](#). The YANG module itself is defined in [Section 2.3](#).

2.1. Data Model Overview

This section provides an overview of the "ietf-http-client" module in terms of its features and groupings.

2.1.1. Features

The following diagram lists all the "feature" statements defined in the "ietf-http-client" module:

Features:

```
+-- proxy-connect
+-- basic-auth
+-- tcp-supported
+-- tls-supported
```

The diagram above uses syntax that is similar to but not defined in [\[RFC8340\]](#).

2.1.2. Groupings

The "ietf-http-client" module defines the following "grouping" statements:

```
*http-client-identity-grouping
*http-client-grouping
*http-client-stack-grouping
```

Each of these groupings are presented in the following subsections.

2.1.2.1. The "http-client-identity-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "http-client-identity-grouping" grouping:

```
grouping http-client-identity-grouping
  +-- client-identity!
    +-- (auth-type)
      +--:(basic)
        +-- basic {basic-auth}?
          +-- user-id                string
          +---u ct:password-grouping
```

Comments:

*This grouping exists because it is used three times by the "http-client-grouping" discussed in [Section 2.1.2.2](#).

*The "client-identity" node is a "presence" container so the mandatory descendant nodes do not imply that this node must be configured, as a client identity may be configured at protocol layers.

*The "basic" authentication scheme is the only scheme defined by this module, albeit it must be enabled via the "basic-auth" feature (see [Section 2.1.1](#)).

*Other authentication schemes MAY be augmented in as needed by the application.

2.1.2.2. The "http-client-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "http-client-grouping" grouping:

```

grouping http-client-grouping
+---u http-client-identity-grouping
+-- proxy-connect! {proxy-connect}?
+-- (proxy-type)
+--:(http)
| +-- http-proxy
|   +-- tcp-client-parameters
|   | +---u tcpc:tcp-client-grouping
|   +-- http-client-parameters
|       +---u http-client-identity-grouping
+--:(https)
+-- https-proxy
+-- tcp-client-parameters
| +---u tcpc:tcp-client-grouping
+-- tls-client-parameters
| +---u tlsc:tls-client-grouping
+-- http-client-parameters
+---u http-client-identity-grouping

```

Comments:

*The "http-client-grouping" defines the configuration for just "HTTP" part of a protocol stack. It does not, for instance, define any configuration for the "TCP" or "TLS" protocol layers (for that, see [Section 2.1.2.3](#)).

*Beyond configuring the client's identity, via the "http-client-identity-grouping" grouping discussed in [Section 2.1.2.1](#), this grouping defines support for HTTP-proxies, albeit it must be enabled via a "feature" statement.

*The "proxy-connect" node is a "presence" container so the mandatory descendant nodes do not imply that this node must be configured, assuming the server supports the "proxy-connect" feature.

*For the referenced grouping statement(s):

- The "http-client-identity-grouping" grouping is discussed in [Section 2.1.2.1](#).
- The "tcp-client-grouping" grouping is discussed in [Section 3.1.2.1](#) of [[I-D.ietf-netconf-tcp-client-server](#)].
- The "tls-client-grouping" grouping is discussed in [Section 3.1.2.1](#) of [[I-D.ietf-netconf-tls-client-server](#)].

2.1.2.3. The "http-client-stack-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "http-client-stack-grouping" grouping:

```

grouping http-client-stack-grouping
  +-- (transport)
    +--:(tcp) {tcp-supported}?
    |   +-- tcp
    |       +-- tcp-client-parameters
    |           | +---u tcpc:tcp-client-grouping
    |           +-- http-client-parameters
    |               +---u http-client-grouping
    +--:(tls) {tls-supported}?
    +-- tls
        +-- tcp-client-parameters
        |   +---u tcpc:tcp-client-grouping
        +-- tls-client-parameters
        |   +---u tlsc:tls-client-grouping
        +-- http-client-parameters
            +---u http-client-grouping

```

Comments:

*The "http-client-stack-grouping" is a convenience grouping for downstream modules. It defines both the "HTTP" and "HTTPS" protocol stacks, with each option enabled by a "feature" statement for application control.

*For the referenced grouping statement(s):

- The "tcp-client-grouping" grouping is discussed in [Section 3.1.2.1](#) of [[I-D.ietf-netconf-tcp-client-server](#)].
- The "tls-client-grouping" grouping is discussed in [Section 3.1.2.1](#) of [[I-D.ietf-netconf-tls-client-server](#)].
- The "http-client-grouping" grouping is discussed in [Section 2.1.2.2](#) in this document.

2.1.3. Protocol-accessible Nodes

The "ietf-http-client" module defines only "grouping" statements that are used by other modules to instantiate protocol-accessible nodes.

2.2. Example Usage

This section presents two examples showing the http-client-grouping populated with some data.

The following example illustrates an HTTP client connecting directly to an HTTP server.

```
<!-- The outermost element below doesn't exist in the data model. -->
<!-- It simulates if the "grouping" were a "container" instead. -->

<http-client xmlns="urn:ietf:params:xml:ns:yang:ietf-http-client">
  <client-identity>
    <basic>
      <user-id>bob</user-id>
      <cleartext-password>secret</cleartext-password>
    </basic>
  </client-identity>
</http-client>
```

The following example illustrates the same client connecting through an HTTP proxy. This example is consistent with examples presented in [Section 2.2](#) of [[I-D.ietf-netconf-trust-anchors](#)] and [Section 2.2](#) of [[I-D.ietf-netconf-keystore](#)].

===== NOTE: '\\' line wrapping per RFC 8792 =====

<!-- The outermost element below doesn't exist in the data model. -->

<!-- It simulates if the "grouping" were a "container" instead. -->

```
<http-client xmlns="urn:ietf:params:xml:ns:yang:ietf-http-client">
  <client-identity>
    <basic>
      <user-id>bob</user-id>
      <cleartext-password>secret</cleartext-password>
    </basic>
  </client-identity>
  <proxy-connect>
    <https-proxy>
      <tcp-client-parameters>
        <remote-address>corp-fw2.example.com</remote-address>
        <keepalives>
          <idle-time>15</idle-time>
          <max-probes>3</max-probes>
          <probe-interval>30</probe-interval>
        </keepalives>
      </tcp-client-parameters>
      <tls-client-parameters>
        <client-identity>
          <certificate>
            <keystore-reference>
              <asymmetric-key>rsa-asymmetric-key</asymmetric-key>
              <certificate>ex-rsa-cert</certificate>
            </keystore-reference>
          </certificate>
        </client-identity>
        <server-authentication>
          <ca-certs>
            <truststore-reference>trusted-server-ca-certs</truststor\
e-reference>

```

<CODE ENDS>

3. The "ietf-http-server" Module

This section defines a YANG 1.1 module called "ietf-http-server". A high-level overview of the module is provided in [Section 3.1](#). Examples illustrating the module's use are provided in [Examples \(Section 3.2\)](#). The YANG module itself is defined in [Section 3.3](#).

3.1. Data Model Overview

This section provides an overview of the "ietf-http-server" module in terms of its features and groupings.

3.1.1. Features

The following diagram lists all the "feature" statements defined in the "ietf-http-server" module:

Features:

```
+-- client-auth-supported
+-- local-users-supported
+-- basic-auth
+-- tcp-supported
+-- tls-supported
```

The diagram above uses syntax that is similar to but not defined in [\[RFC8340\]](#).

3.1.2. Groupings

The "ietf-http-server" module defines the following "grouping" statements:

```
*http-server-grouping
*http-server-stack-grouping
```

Each of these groupings are presented in the following subsections.

3.1.2.1. The "http-server-grouping" Grouping

The following tree diagram [\[RFC8340\]](#) illustrates the "http-server-grouping" grouping:

```

grouping http-server-grouping
+-- server-name?          string
+-- client-authentication! {client-auth-supported}?
  +-- users {local-users-supported}?
    +-- user* [user-id]
      +-- user-id?        string
      +-- (auth-type)
        +--:(basic)
          +-- basic {basic-auth}?
            +-- user-id?   string
            +-- password?  ianach:crypt-hash

```

Comments:

*The "http-server-grouping" defines the configuration for just "HTTP" part of a protocol stack. It does not, for instance, define any configuration for the "TCP" or "TLS" protocol layers (for that, see [Section 3.1.2.2](#)).

*The "server-name" node defines the HTTP server's name, as presented to HTTP clients.

*The "client-authentication" node, which must be enabled by a feature, defines a very simple user-database. Only the "basic" authentication scheme is supported, albeit it must be enabled by a "feature". Other authentication schemes MAY be augmented in.

3.1.2.2. The "http-server-stack-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "http-server-stack-grouping" grouping:

```

grouping http-server-stack-grouping
+-- (transport)
  +--:(tcp) {tcp-supported}?
    | +-- tcp
    |   +-- tcp-server-parameters
    |     | +---u tcps:tcp-server-grouping
    |     +-- http-server-parameters
    |         +---u http-server-grouping
  +--:(tls) {tls-supported}?
    +-- tls
      +-- tcp-server-parameters
      |   +---u tcps:tcp-server-grouping
      +-- tls-server-parameters
      |   +---u tlss:tls-server-grouping
      +-- http-server-parameters
          +---u http-server-grouping

```

Comments:

*The "http-server-stack-grouping" is a convenience grouping for downstream modules. It defines both the "HTTP" and "HTTPS" protocol stacks, with each option enabled by a "feature" statement for application control.

*For the referenced grouping statement(s):

- The "tcp-server-grouping" grouping is discussed in [Section 4.1.2.1](#) of [[I-D.ietf-netconf-tcp-client-server](#)].
- The "tls-server-grouping" grouping is discussed in [Section 4.1.2.1](#) of [[I-D.ietf-netconf-tls-client-server](#)].
- The "http-server-grouping" grouping is discussed in [Section 3.1.2.1](#) in this document.

3.1.3. Protocol-accessible Nodes

The "ietf-http-server" module defines only "grouping" statements that are used by other modules to instantiate protocol-accessible nodes.

3.2. Example Usage

This section presents an example showing the http-server-grouping populated with some data.

```
<!-- The outermost element below doesn't exist in the data model. -->
<!-- It simulates if the "grouping" were a "container" instead. -->

<http-server xmlns="urn:ietf:params:xml:ns:yang:ietf-http-server">
  <server-name>foo.example.com</server-name>
</http-server>
```

3.3. YANG Module

This YANG module has normative references to [[RFC6991](#)].

<CODE BEGINS> file "ietf-http-server@2022-03-07.yang"

```

module ietf-http-server {

    }
}
}
} // http-server-stack-grouping
}

```

<CODE ENDS>

4. Security Considerations

4.1. The "ietf-http-client" YANG Module

The "ietf-http-client" YANG module defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC8341](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

One readable data node defined in this YANG module may be considered sensitive or vulnerable in some network environments. This node is as follows:

*The "client-identity/basic/password" node:

The cleartext "password" node defined in the "http-client-identity-grouping" grouping is additionally sensitive to read operations such that, in normal use cases, it should never be returned to a client. For this reason, the NACM extension "default-deny-all" has been applied to it.

Please be aware that this module uses the "key" and "private-key" nodes from the "ietf-crypto-types" module [[I-D.ietf-netconf-crypto-types](#)], where said nodes have the NACM extension "default-deny-all" set, thus preventing unrestricted read-access to the cleartext key values.

None of the writable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-write" extension has not been set for any data nodes defined in this module.

Please be aware that this module uses groupings from the "ietf-tls-client" and "ietf-tls-server" modules defined in [[I-D.ietf-netconf-tls-client-server](#)]. All of the data nodes defined in these groupings have the NACM extension "default-deny-write" set, thus preventing unrestricted write-access to the data nodes defined in those groupings.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

4.2. The "ietf-http-server" YANG Module

The "ietf-http-server" YANG module defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC8341](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

None of the readable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-all" extension has not been set for any data nodes defined in this module.

None of the writable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-write" extension has not been set for any data nodes defined in this module.

Please be aware that this module uses groupings from the "ietf-tls-client" and "ietf-tls-server" modules defined in [[I-D.ietf-netconf-tls-client-server](#)]. All of the data nodes defined in these groupings have the NACM extension "default-deny-write" set, thus preventing unrestricted write-access to the data nodes defined in those groupings.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

5. IANA Considerations

5.1. The "IETF XML" Registry

This document registers two URIs in the "ns" subregistry of the IETF XML Registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registrations are requested:

URI: urn:ietf:params:xml:ns:yang:ietf-http-client
Registrant Contact: The IESG
XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-http-server
Registrant Contact: The IESG
XML: N/A, the requested URI is an XML namespace.

5.2. The "YANG Module Names" Registry

This document registers two YANG modules in the YANG Module Names registry [RFC6020]. Following the format in [RFC6020], the following registrations are requested:

name: ietf-http-client
namespace: urn:ietf:params:xml:ns:yang:ietf-http-client
prefix: httpc
reference: RFC GGGG

name: ietf-http-server
namespace: urn:ietf:params:xml:ns:yang:ietf-http-server
prefix: https
reference: RFC GGGG

Appendix A. Change Log

This section is to be removed before publishing as an RFC.

A.1. 00 to 01

- *Modified Abstract and Intro to be more accurate wrt intended applicability.
- *In ietf-http-client, removed "protocol-version" and all auth schemes except "basic".
- *In ietf-http-client, factored out "client-identity-grouping" for proxy connections.
- *In ietf-http-server, removed "choice required-or-optional" and "choice local-or-external".
- *In ietf-http-server, moved the basic auth under a "choice auth-type" limited by new "feature basic-auth".

A.2. 01 to 02

- *Removed the unused "external-client-auth-supported" feature from ietf-http-server.

A.3. 02 to 03

- *Removed "protocol-versions" from ietf-http-server based on HTTP WG feedback.
- *Slightly restructured the "proxy-server" definition in ietf-http-client.
- *Added http-client example show proxy server use.
- *Added a "Note to Reviewers" note to first page.

A.4. 03 to 04

- *Added a parent "container" to "client-identity-grouping" so that it could be better used by the proxy model.
- *Added a "choice" to the proxy model enabling selection of proxy types.
- *Added 'http-client-stack-grouping' and 'http-server-stack-grouping' convenience groupings.
- *Expanded "Data Model Overview section(s) [remove "wall" of tree diagrams].
- *Updated the Security Considerations section.

A.5. 04 to 05

- *Fixed titles and a ref in the IANA Considerations section
- *Cleaned up examples (e.g., removed FIXMEs)
- *Fixed issues found by the SecDir review of the "keystore" draft.
- *Updated the "ietf-http-client" module to use the new "password-grouping" grouping from the "crypto-types" module.

A.6. 05 to 06

- *Removed note questioning if okay for app to augment-in a 'path' node when needed, discussed during the 108 session.
- *Addressed comments raised by YANG Doctor in the ct/ts/ks drafts.

A.7. 06 to 07

- *Added XML-comment above examples explaining the reason for the unusual top-most element's presence.
- *Renamed 'client-auth-config-supported' to 'client-auth-supported' consistent with other drafts.
- *Wrapped 'container basic' choice inside a 'case basic' per best practice.
- *Aligned modules with `pyang -f` formatting.
- *Fixed nits found by YANG Doctor reviews.

A.8. 07 to 08

- *Replaced "base64encodedvalue==" with "BASE64VALUE=" in examples.
- *Minor editorial nits

A.9. 08 to 09

- *Fixed up the 'WG Web' and 'WG List' lines in YANG module(s)
- *Fixed up copyright (i.e., s/Simplified/Revised/) in YANG module(s)

Acknowledgements

The authors would like to thank for following for lively discussions on list and in the halls (ordered by first name): Ben Schwartz, Mark Nottingham, Rob Wilton (contributor), and Willy Tarreau.
