

**Keystore Model**  
**[draft-ietf-netconf-keystore-00](#)**

**Abstract**

This document defines a YANG data module for a system-level keystore mechanism, that might be used to hold onto private keys and certificates that are trusted by the system advertising support for this module.

**Editorial Note (To be removed by RFC Editor)**

This draft contains many placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

This document contains references to other drafts in progress, both in the Normative References section, as well as in body text throughout. Please update the following references to reflect their final RFC assignments:

- o [draft-ietf-netconf-restconf](#)
- o [draft-ietf-netconf-call-home](#)
- o [draft-ietf-rtgwg-yang-key-chain](#)

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

- o "VVVV" --> the assigned RFC value for this draft
- o "XXXX" --> the assigned RFC value for [draft-ietf-netconf-restconf](#)
- o "YYYY" --> the assigned RFC value for [draft-ietf-netconf-call-home](#)

Artwork in this document contains placeholder values for ports pending IANA assignment from "[draft-ietf-netconf-call-home](#)". Please apply the following replacements:

- o "7777" --> the assigned port value for "netconf-ch-ssh"
- o "8888" --> the assigned port value for "netconf-ch-tls"
- o "9999" --> the assigned port value for "restconf-ch-tls"

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

- o "2016-10-31" --> the publication date of this draft

The following two Appendix sections are to be removed prior to publication:

- o [Appendix A.](#) Change Log
- o [Appendix B.](#) Open Issues

#### Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 4, 2017.

## 1. Introduction

This document defines a YANG [[RFC6020](#)] data module for a system-level keystore mechanism, which can be used to hold onto private keys and certificates that are trusted by the system advertising support for this module.

This module provides a centralized location for security sensitive data, so that the data can be then referenced by other modules. There are two types of data that are maintained by this module:

- o Private keys, and any associated public certificates.
- o Sets of trusted certificates.

This document extends special consideration for systems that have Trusted Protection Modules (TPMs). These systems are unique in that the TPM must be directed to generate new private keys (it is not possible to load a private key into a TPM) and it is not possible to backup/restore the TPM's private keys as configuration.

Watson & Wu

Expires May 4, 2017

[Page 3]

It is not required that a system has an operating system level keystore utility to implement this module.

### **1.1. Requirements Language**

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

### **1.2. Tree Diagram Notation**

A simplified graphical representation of the data models is used in this document. The meaning of the symbols in these diagrams is as follows:

- o Brackets "[" and "]" enclose list keys.
- o Braces "{" and "}" enclose feature names, and indicate that the named feature must be present for the subtree to be present.
- o Abbreviations before data node names: "rw" means configuration (read-write) and "ro" state data (read-only).
- o Symbols after data node names: "?" means an optional node, "!" means a presence container, and "\*" denotes a list and leaf-list.
- o Parentheses enclose choice and case nodes, and case nodes are also marked with a colon ":".
- o Ellipsis ("...") stands for contents of subtrees that are not shown.

## **2. The Keystore Model**

The keystore module defined in this section provides a configurable object having the following characteristics:

- o A semi-configurable list of private keys, each with one or more associated certificates. Private keys MUST be either preinstalled (e.g., a key associated to an IDevID [[Std-802.1AR-2009](#)]  
certificate), be generated by request, or be loaded by request.  
Each private key is MAY have associated certificates, either  
preinstalled or configured after creation.
- o A configurable list of lists of trust anchor certificates. This  
enables the server to have use-case specific trust anchors. For  
instance, one list of trust anchors might be used to authenticate  
management connections (e.g., client certificate-based

Watson & Wu

Expires May 4, 2017

[Page 4]

authentication for NETCONF or RESTCONF connections), and a different list of trust anchors might be used for when connecting to a specific Internet-based service (e.g., a zero touch bootstrap server).

- o An RPC to generate a certificate signing request for an existing private key, a passed subject, and an optional attributes. The signed certificate returned from an external certificate authority (CA) can be later set using a standard configuration change request (e.g., <edit-config>).
- o An RPC to request the server to generate a new private key using the specified algorithm and key length.
- o An RPC to request the server to load a new private key.

## [2.1. Overview](#)

The keystore module has the following tree diagram. Please see [Section 1.2](#) for information on how to interpret this diagram.

```
module: ietf-keystore
++-rw keystore
  +-rw private-keys

The following example illustrates what a fully configured keystore object might look like. The private-key shown below is consistent with the generate-private-key and generate-certificate-signing-request examples above. This example also assumes that the resulting CA-signed certificate has been configured back onto the server. Lastly, this example shows that three lists of trusted certificates having been configured.

```

<keystore xmlns="urn:ietf:params:xml:ns:yang:ietf-keystore">

<CODE ENDS>

### **3. Design Considerations**

This document, along with four other drafts, was split out from the original draft "[draft-ietf-netconf-server-model](#)". The split was made so that each draft would have better focus, and also because there was a desire to define client modules, in addition to server modules. The complete list of drafts that resulted from the split includes:

- [draft-ietf-netconf-keystore](#)
- [draft-ietf-netconf-ssh-client-server](#)
- [draft-ietf-netconf-tls-client-server](#)
- [draft-ietf-netconf-netconf-client-server](#)
- [draft-ietf-netconf-restconf-client-server](#)

Watson & Wu

Expires May 4, 2017

[Page 28]

This document uses PKCS #10 [[RFC2986](#)] for the "generate-certificate-signing-request" action. The use of Certificate Request Message Format (CRMF) [[RFC4211](#)] was considered, but it was unclear if there was market demand for it, and so support for CRMF has been left out of this specification. If it is desired to support CRMF in the future, placing a "choice" statement in both the input and output statements, along with an "if-feature" statement on the CRMF option, would enable a backwards compatible solution.

This document puts a limit of the number of elliptical curves supported by default. This was done to match industry trends in IETF best practice (e.g., matching work being done in TLS 1.3). If additional algorithms are needed, they MAY be augmented in by another module, or added directly in a future version of this document.

Both this document and Key Chain YANG Data Model [[draft-ietf-rtgwg-yang-key-chain](#)] regard a similar idea. The authors looked at this and agree that they two modules serve different purposes and hence not worth merging into one document. To underscore this further, this document renamed its module from "ietf-keychain" to "ietf-keystore", to contrast it with the other document's module "ietf-key-chain".

For the trusted-certificates list, Trust Anchor Format [[RFC5914](#)] was evaluated and deemed inappropriate due to this document's need to also support pinning. That is, pinning a client-certificate to support NETCONF over TLS client authentication.

#### **[4. Security Considerations](#)**

This document defines a keystore mechanism that is entrusted with the safe keeping of private keys, and the safe keeping of trusted certificates. Nowhere in this API is there an ability to access (read out) a private key once it is known to the keystore. Further, associated public keys and attributes (e.g., algorithm name, key length, etc.) are read-only. That said, this document allows for the deletion of private keys and their certificates, as well the deletion of trusted certificates. Access control mechanisms (e.g., NACM [[RFC6536](#)]) MUST be in place so as to authorize such client actions. Further, whilst the data model allows for private keys and trusted certificates in general to be deleted, implementations should be well aware that some private keys (e.g., those in a TPM) and some trusted certificates, should never be deleted, regardless if the authorization mechanisms would generally allow for such actions.

For the "generate-certificate-signing-request" action, it is RECOMMENDED that devices implement assert channel binding [[RFC5056](#)], so as to ensure that the application layer that sent the request is

Watson & Wu

Expires May 4, 2017

[Page 29]

the same as the device authenticated in the secure transport layer was established.

This document defines a data model that includes a list of private keys. These private keys MAY be deleted using standard NETCONF or RESTCONF operations (e.g., <edit-config>). Implementations SHOULD automatically (without explicit request) zeroize these keys in the most secure manner available, so as to prevent the remnants of their persisted storage locations from being analyzed in any meaningful way.

The keystore module define within this document defines the "load-private-key" action enabling a device to load a client-supplied private key. This is a private key with no shrouding to protect it. The strength of this private key MUST NOT be greater than the strength of the underlying secure transport connection over which it is communicated. Devices SHOULD fail this request if ever the strength of the private key is greater then the strength of the underlying transport.

## **5. IANA Considerations**

### **5.1. The IETF XML Registry**

This document registers one URI in the IETF XML registry [[RFC2119](#)]. Following the format in [[RFC3688](#)], the following registration is requested:

URI: urn:ietf:params:xml:ns:yang:ietf-keystore  
Registrant Contact: The NETCONF WG of the IETF.  
XML: N/A, the requested URI is an XML namespace.

### **5.2. The YANG Module Names Registry**

This document registers one YANG module in the YANG Module Names registry [[RFC6020](#)]. Following the format in [[RFC6020](#)], the the following registration is requested:

```
name:          ietf-keystore
namespace:     urn:ietf:params:xml:ns:yang:ietf-keystore
prefix:        kc
reference:    RFC VVVV
```

## Appendix A. Change Log

### A.1. server-model-09 to 00

- o This draft was split out from [draft-ietf-netconf-server-model-09](#).
- o Removed key-usage parameter from generate-private-key action.
- o Now /private-keys/private-key/certificates/certificate/name must be globally unique (unique across all private keys).
- o Added top-level 'trusted-ssh-host-keys' and 'user-auth-credentials' to support SSH client modules.

## Appendix B. Open Issues
