YANG Data Model for a Centralized Keystore Mechanism
draft-ietf-netconf-keystore-09

Abstract

   This document defines a YANG 1.1 module called "ietf-keystore" that
   enables centralized configuration of asymmetric keys and their
   associated certificates, and notification for when configured
   certificates are about to expire.

Editorial Note (To be removed by RFC Editor)

   This draft contains many placeholder values that need to be replaced
   with finalized values at the time of publication. This note
   summarizes all of the substitutions that are needed. No other RFC
   Editor instructions are specified elsewhere in this document.

   Artwork in this document contains shorthand references to drafts in
   progress. Please apply the following replacements:

   o "VVVV" --> the assigned RFC value for this draft

   Artwork in this document contains placeholder values for the date of
   publication of this draft. Please apply the following replacement:

   o "2019-04-29" --> the publication date of this draft

   The following Appendix section is to be removed prior to publication:

   o Appendix A. Change Log

Status of This Memo

   This Internet-Draft is submitted in full conformance with the
   provisions of BCP 78 and BCP 79.

   Internet-Drafts are working documents of the Internet Engineering
   Task Force (IETF). Note that other groups may also distribute
   working documents as Internet-Drafts. The list of current Internet-
   Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months
and may be updated, replaced, or obsoleted by other documents at any
time. It is inappropriate to use Internet-Drafts as reference
material or to cite them other than as "work in progress."

This Internet-Draft will expire on October 31, 2019.

Table of Contents

[1](#). Introduction

   This document defines a YANG 1.1 [[RFC7950](#)] module called "ietf-
   keystore" that enables centralized configuration of asymmetric keys
   and their associated certificates, and notification for when
   configured certificates are about to expire.

   This module also defines Six groupings designed for maximum reuse.
   These groupings include one for the public half of an asymmetric key,
   one for both the public and private halves of an asymmetric key, one
   for both halves of an asymmetric key and a list of associated
   certificates, one for an asymmetric key that may be configured
   locally or via a reference to an asymmetric key in the keystore, one
   for a trust anchor certificate and, lastly, one for an end entity
   certificate.

   Special consideration has been given for systems that have
   cryptographic hardware, such as a Trusted Protection Module (TPM).
   These systems are unique in that the cryptographic hardware
   completely hides the private keys and must perform all private key
   operations. To support such hardware, the "private-key" can be the
   special value "permanently-hidden" and the actions "generate-hidden-
   key" and "generate-certificate-signing-request" can be used to direct
   these operations to the hardware .

   This document in compliant with Network Management Datastore
   Architecture (NMDA) [[RFC8342](#)]. For instance, to support keys and
   associated certificates installed during manufacturing (e.g., for a
   IDevID [[Std-802.1AR-2009](#)] certificate), it is expected that such data
   may appear only in <operational>.

   While only asymmetric keys are currently supported, the module has
   been designed to enable other key types to be introduced in the
   future.

   The module does not support protecting the contents of the keystore
   (e.g., via encryption), though it could be extended to do so in the
   future.

   It is not required that a system has an operating system level
   keystore utility to implement this module.

2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
"SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and
"OPTIONAL" in this document are to be interpreted as described in BCP
14 [RFC2119] [RFC8174] when, and only when, they appear in all
capitals, as shown here.

3. The Keystore Model

3.1. Tree Diagram

This section provides a tree diagrams [RFC8340] for the "ietf-
keystore" module that presents both the protocol-accessible
"keystore" as well the all the groupings intended for external usage.

```
module: ietf-keystore
  +--rw keystore
     +--rw asymmetric-keys
        +--rw asymmetric-key* [name]
           +--rw name                                 string

```

3.2. Example Usage

The following example illustrates what a fully configured keystore
might look like in <operational>, as described by Section 5.3 in
[RFC8342]. This datastore view illustrates data set by the
manufacturing process alongside conventional configuration. This
keystore instance has four keys, two having one associated
certificate, one having two associated certificates, and one empty
key.

========== NOTE: '\' line wrapping per BCP XX (RFC XXXX) ==========

```
<keystore xmlns="urn:ietf:params:xml:ns:yang:ietf-keystore"
        xmlns:or="urn:ietf:params:xml:ns:yang:ietf-origin"
        xmlns:ct="urn:ietf:params:xml:ns:yang:ietf-crypto-types"
        or:origin="or:intended">

            </certificate>
          </certificates>
        </asymmetric-key>
```

```
      </asymmetric-keys>
    </keystore>

    The following example module has been constructed to illustrate the
    "local-or-keystore-asymmetric-key-grouping" grouping defined in the
    "ietf-keystore" module.

    module ex-keystore-usage {
      yang-version 1.1;

      namespace "http://example.com/ns/example-keystore-usage";
      prefix "eku";

      import ietf-keystore {
        prefix ks;
        reference
          "RFC VVVV: YANG Data Model for a 'Keystore' Mechanism";
      }

      organization
       "Example Corporation";

      contact
       "Author: YANG Designer <mailto:yang.designer@example.com>";

      description
       "This module illustrates the grouping in the keystore draft called
        'local-or-keystore-asymmetric-key-with-certs-grouping'.";

      revision "YYYY-MM-DD" {
        description
         "Initial version";
        reference
         "RFC XXXX: YANG Data Model for a 'Keystore' Mechanism";
      }

      container keystore-usage {
        description
          "An illustration of the various keystore groupings.";

        list just-a-key {
          key name;
          leaf name {
            type string;
            description
              "An arbitrary name for this key.";
          }
```

```
      uses ks:local-or-keystore-asymmetric-key-grouping;
      description
        "An asymmetric key, with no certs, that may be configured
         locally or be a reference to an asymmetric key in the
         keystore.  The intent is to reference just the asymmetric
         key, not any certificates that may also be associated
         with the asymmetric key.";
    }

    list key-with-certs {
      key name;
      leaf name {
        type string;
        description
          "An arbitrary name for this key.";
      }
      uses ks:local-or-keystore-asymmetric-key-with-certs-grouping;
      description
        "An asymmetric key and its associated certs, that may be
         configured locally or be a reference to an asymmetric key
         (and its associated certs) in the keystore.";
    }

    list end-entity-cert-with-key {
      key name;
      leaf name {
        type string;
        description
          "An arbitrary name for this key.";
      }
      uses ks:local-or-keystore-end-entity-cert-with-key-grouping;
      description
        "An end-entity certificate, and its associated private key,
         that may be configured locally or be a reference to a
         specific certificate (and its associated private key) in
         the keystore.";
    }
  }

}
```

The following example illustrates what two configured keys, one local
and the other remote, might look like. This example consistent with
other examples above (i.e., the referenced key is in an example
above).

4. Security Considerations

   The YANG module defined in this document is designed to be accessed
   via YANG based management protocols, such as NETCONF [RFC6241] and
   RESTCONF [RFC8040]. Both of these protocols have mandatory-to-
   implement secure transport layers (e.g., SSH, TLS) with mutual
   authentication.

   The NETCONF access control model (NACM) [RFC8341] provides the means
   to restrict access for particular users to a pre-configured subset of
   all available protocol operations and content.

   There are a number of data nodes defined in this YANG module that are
   writable/creatable/deletable (i.e., config true, which is the
   default). These data nodes may be considered sensitive or vulnerable
   in some network environments. Write operations (e.g., edit-config)
   to these data nodes without proper protection can have a negative
   effect on network operations. These are the subtrees and data nodes
   and their sensitivity/vulnerability:

      /: The entire data tree defined by this module is sensitive to
         write operations. For instance, the addition or removal of
         keys, certificates, etc., can dramatically alter the
         implemented security policy. For this reason, the NACM
         extension "default-deny-write" has been set for the entire data
         tree.

      /keystore/asymmetric-keys/asymmetric-key/private-key: When
         writing this node, implementations MUST ensure that the
         strength of the key being configured is not greater than the
         strength of the underlying secure transport connection over
         which it is communicated. Implementations SHOULD fail the
         write-request if ever the strength of the private key is
         greater then the strength of the underlying transport, and
         alert the client that the strength of the key may have been
         compromised. Additionally, when deleting this node,
         implementations SHOULD automatically (without explicit request)
         zeroize these keys in the most secure manner available, so as
         to prevent the remnants of their persisted storage locations
         from being analyzed in any meaningful way.

   Some of the readable data nodes in this YANG module may be considered
   sensitive or vulnerable in some network environments. It is thus

important to control read access (e.g., via get, get-config, or
notification) to these data nodes. These are the subtrees and data
nodes and their sensitivity/vulnerability:

   /keystore/asymmetric-keys/asymmetric-key/private-key: This node
      is additionally sensitive to read operations such that, in
      normal use cases, it should never be returned to a client. The
      best reason for returning this node is to support backup/
      restore type workflows. For this reason, the NACM extension
      "default-deny-all" has been set for this data node.

5. IANA Considerations

5.1. The IETF XML Registry

This document registers one URI in the "ns" subregistry of the IETF
XML Registry [RFC3688]. Following the format in [RFC3688], the
following registration is requested:

   URI: urn:ietf:params:xml:ns:yang:ietf-keystore
   Registrant Contact: The NETCONF WG of the IETF.
   XML: N/A, the requested URI is an XML namespace.

5.2. The YANG Module Names Registry

This document registers one YANG module in the YANG Module Names
registry [RFC6020]. Following the format in [RFC6020], the the
following registration is requested:

   name: ietf-keystore
   namespace: urn:ietf:params:xml:ns:yang:ietf-keystore
   prefix: ks
   reference: RFC VVVV

              standard/802.1AR-2009.html>.

[Appendix A](#).   **Change Log**

[A.1](#).   **00 to 01**

o Replaced the 'certificate-chain' structures with PKCS#7
   structures. (Issue #1)

o Added 'private-key' as a configurable data node, and removed the
   'generate-private-key' and 'load-private-key' actions. (Issue #2)

o Moved 'user-auth-credentials' to the ietf-ssh-client module.
   (Issues #4 and #5)

[A.2](#).   **01 to 02**

o Added back 'generate-private-key' action.

o Removed 'RESTRICTED' enum from the 'private-key' leaf type.

o Fixed up a few description statements.

[A.3](#).   **02 to 03**

o Changed draft's title.

o Added missing references.

o Collapsed sections and levels.

o Added [RFC 8174](#) to Requirements Language Section.

o Renamed 'trusted-certificates' to 'pinned-certificates'.

o Changed 'public-key' from config false to config true.

o Switched 'host-key' from OneAsymmetricKey to definition from [RFC 4253](#).

[A.4](#).   **03 to 04**

o Added typedefs around leafrefs to common keystore paths

o Now tree diagrams reference ietf-netmod-yang-tree-diagrams

o Removed Design Considerations section

o Moved key and certificate definitions from data tree to groupings

A.5. **04 to 05**

   o Removed trust anchors (now in their own draft)

   o Added back global keystore structure

   o Added groupings enabling keys to either be locally defined or a
      reference to the keystore.

A.6. **05 to 06**

   o Added feature "local-keys-supported"

   o Added nacm:default-deny-all and nacm:default-deny-write

   o Renamed generate-asymmetric-key to generate-hidden-key

   o Added an install-hidden-key action

   o Moved actions inside fo the "asymmetric-key" container

   o Moved some groupings to draft-ietf-netconf-crypto-types

A.7. **06 to 07**

   o Removed a "require-instance false"

   o Clarified some description statements

   o Improved the keystore-usage examples

A.8. **07 to 08**

   o Added "local-definition" containers to avoid posibility of the
      action/notification statements being under a "case" statement.

   o Updated copyright date, boilerplate template, affiliation, folding
      algorithm, and reformatted the YANG module.

A.9. **08 to 09**

   o Added a 'description' statement to the 'must' in the /keystore/
      asymmetric-key node explaining that the descendent values may
      exist in <operational> only, and that implementation MUST assert
      that the values are either configured or that they exist in
      <operational>.

   o Copied above 'must' statement (and description) into the local-or-
      keystore-asymmetric-key-grouping, local-or-keystore-asymmetric-
      key-with-certs-grouping, and local-or-keystore-end-entity-cert-
      with-key-grouping statements.
