RESTCONF Client and Server Models

Abstract

This document defines two YANG modules, one module to configure a RESTCONF client and the other module to configure a RESTCONF server. Both modules support the TLS transport protocol with both standard RESTCONF and RESTCONF Call Home connections.

Editorial Note (To be removed by RFC Editor)

This draft contains placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements (note: not all may be present):

*AAAA --> the assigned RFC value for draft-ietf-netconf-crypto-types

*BBBB --> the assigned RFC value for draft-ietf-netconf-trust-anchors

*CCCC --> the assigned RFC value for draft-ietf-netconf-keystore

*DDDD --> the assigned RFC value for draft-ietf-netconf-tcp-client-server

*EEEE --> the assigned RFC value for draft-ietf-netconf-ssh-client-server

*FFFF --> the assigned RFC value for draft-ietf-netconf-tls-client-server

*GGGG --> the assigned RFC value for draft-ietf-netconf-http-client-server

*HHHH --> the assigned RFC value for draft-ietf-netconf-netconf-client-server

*IIII --> the assigned RFC value for this draft

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

*2022-03-07 --> the publication date of this draft

The following Appendix section is to be removed prior to publication:

*[Appendix A](#). Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 8 September 2022.

1. Introduction

This document defines two YANG [[RFC7950](#)] modules, one module to configure a RESTCONF client and the other module to configure a RESTCONF server [[RFC8040](#)]. Both modules support the TLS [[RFC8446](#)] transport protocol with both standard RESTCONF and RESTCONF Call Home connections [[RFC8071](#)].

1.1. Relation to other RFCs

This document presents one or more YANG modules [[RFC7950](#)] that are part of a collection of RFCs that work together to, ultimately, enable the configuration of the clients and servers of both the NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)] protocols.

The modules have been defined in a modular fashion to enable their use by other efforts, some of which are known to be in progress at the time of this writing, with many more expected to be defined in time.

The normative dependency relationship between the various RFCs in the collection is presented in the below diagram. The labels in the diagram represent the primary purpose provided by each RFC. Hyperlinks to each RFC are provided below the diagram.

Label in Diagram	Originating RFC
crypto-types	[I-D.ietf-netconf-crypto-types]
truststore	[I-D.ietf-netconf-trust-anchors]
keystore	[I-D.ietf-netconf-keystore]
tcp-client-server	[I-D.ietf-netconf-tcp-client-server]
ssh-client-server	[I-D.ietf-netconf-ssh-client-server]
tls-client-server	[I-D.ietf-netconf-tls-client-server]
http-client-server	[I-D.ietf-netconf-http-client-server]
netconf-client-server	[I-D.ietf-netconf-netconf-client-server]
restconf-client-server	[I-D.ietf-netconf-restconf-client-server]

Table 1: Label to RFC Mapping

1.2. Specification Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

1.3. Adherence to the NMDA

This document is compliant with the Network Management Datastore Architecture (NMDA) [[RFC8342](#)]. For instance, as described in [[I-](#)

[D.ietf-netconf-trust-anchors](#)] and [[I-D.ietf-netconf-keystore](#)], trust anchors and keys installed during manufacturing are expected to appear in <operational>.

1.4. Conventions

Various examples used in this document use a placeholder value for binary data that has been base64 encoded (e.g., "BASE64VALUE="). This placeholder value is used as real base64 encoded structures are often many lines long and hence distracting to the example being presented.

2. The "ietf-restconf-client" Module

The RESTCONF client model presented in this section supports both clients initiating connections to servers, as well as clients listening for connections from servers calling home.

YANG feature statements are used to enable implementations to advertise which potentially uncommon parts of the model the RESTCONF client supports.

2.1. Data Model Overview

This section provides an overview of the "ietf-restconf-client" module in terms of its features and groupings.

2.1.1. Features

The following diagram lists all the "feature" statements defined in the "ietf-restconf-client" module:

Features:

```
+-- https-initiate
+-- http-listen
+-- https-listen
```

The diagram above uses syntax that is similar to but not defined in [[RFC8340](#)].

2.1.2. Groupings

The "ietf-restconf-client" module defines the following "grouping" statements:

```
*restconf-client-grouping
*restconf-client-initiate-stack-grouping
*restconf-client-listen-stack-grouping
*restconf-client-app-grouping
```

Each of these groupings are presented in the following subsections.

2.1.2.1. The "restconf-client-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "restconf-client-grouping" grouping:

```
grouping restconf-client-grouping ---> <empty>
```

Comments:

*This grouping does not define any nodes, but is maintained so that downstream modules can augment nodes into it if needed.

*The "restconf-client-grouping" defines, if it can be called that, the configuration for just "RESTCONF" part of a protocol stack. It does not, for instance, define any configuration for the "TCP", "TLS", or "HTTP" protocol layers (for that, see [Section 2.1.2.2](#) and [Section 2.1.2.3](#)).

2.1.2.2. The "restconf-client-initiate-stack-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "restconf-client-initiate-stack-grouping" grouping:

```
grouping restconf-client-initiate-stack-grouping
+- (transport)
+--:(https) {https-initiate}?
    +-- https
        +-- tcp-client-parameters
            | +---u tcp:tcp-client-grouping
        +-- tls-client-parameters
            | +---u tlsc:tls-client-grouping
        +-- http-client-parameters
            | +---u http:http-client-grouping
        +-- restconf-client-parameters
            +---u rcc:restconf-client-grouping
```

Comments:

*The "restconf-client-initiate-stack-grouping" defines the configuration for a full RESTCONF protocol stack, for RESTCONF clients that initiate connections to RESTCONF servers, as opposed to receiving call-home [[RFC8071](#)] connections.

*The "transport" choice node enables transport options to be configured. This document only defines an "https" option, but other options MAY be augmented in.

*For the referenced grouping statement(s):

- The "tcp-client-grouping" grouping is discussed in [Section 3.1.2.1](#) of [[I-D.ietf-netconf-tcp-client-server](#)].
- The "tls-client-grouping" grouping is discussed in [Section 3.1.2.1](#) of [[I-D.ietf-netconf-tls-client-server](#)].
- The "http-client-grouping" grouping is discussed in [Section 2.1.2.2](#) of [[I-D.ietf-netconf-http-client-server](#)].
- The "restconf-client-grouping" grouping is discussed in [Section 2.1.2.1](#) in this document.

2.1.2.3. The "restconf-client-listen-stack-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "restconf-client-listen-stack-grouping" grouping:

```
grouping restconf-client-listen-stack-grouping
+-- (transport)
+--:(http) {http-listen}?
|   +-- http
|       +-- tcp-server-parameters
|           | +---u tcps:tcp-server-grouping
|       +-- http-client-parameters
|           | +---u httpc:http-client-grouping
|       +-- restconf-client-parameters
|           +---u rcc:restconf-client-grouping
+--:(https) {https-listen}?
+-- https
+-- tcp-server-parameters
|   +---u tcps:tcp-server-grouping
+-- tls-client-parameters
|   +---u tlsc:tls-client-grouping
+-- http-client-parameters
|   +---u httpc:http-client-grouping
+-- restconf-client-parameters
+---u rcc:restconf-client-grouping
```

Comments:

*The "restconf-client-listen-stack-grouping" defines the configuration for a full RESTCONF protocol stack, for RESTCONF clients that receive call-home [[RFC8071](#)] connections from RESTCONF servers.

*The "transport" choice node enables both the HTTP and HTTPS transports to be configured, with each option enabled by a "feature" statement. Note that RESTCONF requires HTTPS, the HTTP option is provided to support cases where a TLS-terminator is deployed in front of the RESTCONF-client.

*For the referenced grouping statement(s):

- The "tcp-server-grouping" grouping is discussed in [Section 4.1.2.1](#) of [[I-D.ietf-netconf-tcp-client-server](#)].
- The "tls-client-grouping" grouping is discussed in [Section 3.1.2.1](#) of [[I-D.ietf-netconf-tls-client-server](#)].
- The "http-client-grouping" grouping is discussed in [Section 2.1.2.2](#) of [[I-D.ietf-netconf-http-client-server](#)].
- The "restconf-client-grouping" grouping is discussed in [Section 2.1.2.1](#) in this document.

2.1.2.4. The "restconf-client-app-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "restconf-client-app-grouping" grouping:

```
grouping restconf-client-app-grouping
+-- initiate! {https-initiate}?
|  +-- restconf-server* [name]
|      +-- name? string
|      +-- endpoints
|          | +-- endpoint* [name]
|          |     +-- name? string
|          |     +---u restconf-client-initiate-stack-grouping
|      +-- connection-type
|          | +-- (connection-type)
|          |     +--:(persistent-connection)
|          |         | +-- persistent!
|          |         +--:(periodic-connection)
|          |             +-- periodic!
|          |                 +-- period? uint16
|          |                 +-- anchor-time? yang:date-and-time
|          |                 +-- idle-timeout? uint16
|      +-- reconnect-strategy
|          +-- start-with? enumeration
|          +-- max-attempts? uint8
+-- listen! {http-listen or https-listen}?
    +-- idle-timeout? uint16
    +-- endpoint* [name]
        +-- name? string
        +---u restconf-client-listen-stack-grouping
```

Comments:

*The "restconf-client-app-grouping" defines the configuration for a RESTCONF client that supports both initiating connections to RESTCONF servers as well as receiving call-home connections from RESTCONF servers.

*Both the "initiate" and "listen" subtrees must be enabled by "feature" statements.

*For the referenced grouping statement(s):

- The "restconf-client-initiate-stack-grouping" grouping is discussed in [Section 2.1.2.2](#) in this document.
- The "restconf-client-listen-stack-grouping" grouping is discussed in [Section 2.1.2.3](#) in this document.

2.1.3. Protocol-accessible Nodes

The following tree diagram [[RFC8340](#)] lists all the protocol-accessible nodes defined in the "ietf-restconf-client" module:

```
module: ietf-restconf-client
+--rw restconf-client
   +---u restconf-client-app-grouping
```

Comments:

*Protocol-accessible nodes are those nodes that are accessible when the module is "implemented", as described in [Section 5.6.5](#) of [[RFC7950](#)].

*For the "ietf-restconf-client" module, the protocol-accessible nodes are an instance of the "restconf-client-app-grouping" discussed in [Section 2.1.2.4](#) grouping.

*The reason for why "restconf-client-app-grouping" exists separate from the protocol-accessible nodes definition is so as to enable instances of restconf-client-app-grouping to be instantiated in other locations, as may be needed or desired by some modules.

2.2. Example Usage

The following example illustrates configuring a RESTCONF client to initiate connections, as well as to listen for call-home connections.

This example is consistent with the examples presented in [Section 2.2](#) of [[I-D.ietf-netconf-trust-anchors](#)] and [Section 2.2](#) of [[I-D.ietf-netconf-keystore](#)].

===== NOTE: '\\' line wrapping per RFC 8792 =====

```

<CODE ENDS>

3. The "ietf-restconf-server" Module

The RESTCONF server model presented in this section supports both listening for connections as well as initiating call-home connections.

YANG feature statements are used to enable implementations to advertise which potentially uncommon parts of the model the RESTCONF server supports.

3.1. Data Model Overview

This section provides an overview of the "ietf-restconf-server" module in terms of its features and groupings.

3.1.1. Features

The following diagram lists all the "feature" statements defined in the "ietf-restconf-server" module:

Features:

```
+-- http-listen
+-- https-listen
+-- https-call-home
```

The diagram above uses syntax that is similar to but not defined in [\[RFC8340\]](#).

3.1.2. Groupings

The "ietf-restconf-server" module defines the following "grouping" statements:

```
*restconf-server-grouping
*restconf-server-listen-stack-grouping
*restconf-server-callhome-stack-grouping
*restconf-server-app-grouping
```

Each of these groupings are presented in the following subsections.

3.1.2.1. The "restconf-server-grouping" Grouping

The following tree diagram [\[RFC8340\]](#) illustrates the "restconf-server-grouping" grouping:

```
grouping restconf-server-grouping
+-- client-identity-mappings
+---u x509c2n:cert-to-name
```

Comments:

*The "restconf-server-grouping" defines the configuration for just "RESTCONF" part of a protocol stack. It does not, for instance, define any configuration for the "TCP", "TLS", or "HTTP" protocol layers (for that, see [Section 3.1.2.2](#) and [Section 3.1.2.3](#)).

*The "client-identity-mappings" node, which must be enabled by "feature" statements, defines a mapping from certificate fields to RESTCONF user names.

*For the referenced grouping statement(s):

-The "cert-to-name" grouping is discussed in [Section 4.1](#) of [\[RFC7407\]](#).

3.1.2.2. The "restconf-server-listen-stack-grouping" Grouping

The following tree diagram [\[RFC8340\]](#) illustrates the "restconf-server-listen-stack-grouping" grouping:

```
grouping restconf-server-listen-stack-grouping
+-- (transport)
+--:(http) {http-listen}?
|   +-- http
|   |   +-- external-endpoint!
|   |   |   +-- address      inet:ip-address
|   |   |   +-- port?       inet:port-number
|   |   +-- tcp-server-parameters
|   |   |   +---u tcps:tcp-server-grouping
|   |   +-- http-server-parameters
|   |   |   +---u https:http-server-grouping
|   |   +-- restconf-server-parameters
|   |       +---u rcs:restconf-server-grouping
+--:(https) {https-listen}?
+-- https
+-- tcp-server-parameters
|   +---u tcps:tcp-server-grouping
+-- tls-server-parameters
|   +---u tlss:tls-server-grouping
+-- http-server-parameters
|   +---u https:http-server-grouping
+-- restconf-server-parameters
+---u rcs:restconf-server-grouping
```

Comments:

*The "restconf-server-listen-stack-grouping" defines the configuration for a full RESTCONF protocol stack for RESTCONF servers that listen for standard connections from RESTCONF

clients, as opposed to initiating call-home [[RFC8071](#)] connections.

*The "transport" choice node enables both the HTTP and HTTPS transports to be configured, with each option enabled by a "feature" statement. The HTTP option is provided to support cases where a TLS-terminator is deployed in front of the RESTCONF-server.

*For the referenced grouping statement(s):

- The "tcp-server-grouping" grouping is discussed in [Section 4.1.2.1](#) of [[I-D.ietf-netconf-tcp-client-server](#)].
- The "tls-server-grouping" grouping is discussed in [Section 4.1.2.1](#) of [[I-D.ietf-netconf-tls-client-server](#)].
- The "http-server-grouping" grouping is discussed in [Section 3.1.2.1](#) of [[I-D.ietf-netconf-http-client-server](#)].
- The "restconf-server-grouping" is discussed in [Section 3.1.2.1](#) of this document.

3.1.2.3. The "restconf-server-callhome-stack-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "restconf-server-callhome-stack-grouping" grouping:

```
grouping restconf-server-callhome-stack-grouping
+-- (transport)
+--:(https) {https-listen}?
+-- https
+-- tcp-client-parameters
|  +---u tcp:tcp-client-grouping
+-- tls-server-parameters
|  +---u tlss:tls-server-grouping
+-- http-server-parameters
|  +---u https:http-server-grouping
+-- restconf-server-parameters
    +---u rcs:restconf-server-grouping
```

Comments:

*The "restconf-server-callhome-stack-grouping" defines the configuration for a full RESTCONF protocol stack, for RESTCONF servers that initiate call-home [[RFC8071](#)] connections to RESTCONF clients.

*The "transport" choice node enables transport options to be configured. This document only defines an "https" option, but other options MAY be augmented in.

*For the referenced grouping statement(s):

- The "tcp-client-grouping" grouping is discussed in [Section 3.1.2.1](#) of [[I-D.ietf-netconf-tcp-client-server](#)].
- The "tls-server-grouping" grouping is discussed in [Section 4.1.2.1](#) of [[I-D.ietf-netconf-tls-client-server](#)].
- The "http-server-grouping" grouping is discussed in [Section 3.1.2.1](#) of [[I-D.ietf-netconf-http-client-server](#)].
- The "restconf-server-grouping" is discussed in [Section 3.1.2.1](#) of this document.

3.1.2.4. The "restconf-server-app-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "restconf-server-app-grouping" grouping:

```
grouping restconf-server-app-grouping
+-- listen! {http-listen or https-listen}?
| +-- endpoint* [name]
|   +-- name? string
|   +---u restconf-server-listen-stack-grouping
+-- call-home! {https-call-home}?
  +-- restconf-client* [name]
    +-- name? string
    +-- endpoints
    | +-- endpoint* [name]
    |   +-- name? string
    |   +---u restconf-server-callhome-stack-grouping
    +-- connection-type
    | +-- (connection-type)
    |   +--:(persistent-connection)
    |   | +-- persistent!
    |   +--:(periodic-connection)
    |   | +-- periodic!
    |   |   +-- period? uint16
    |   |   +-- anchor-time? yang:date-and-time
    |   |   +-- idle-timeout? uint16
    +-- reconnect-strategy
      +-- start-with? enumeration
      +-- max-attempts? uint8
```

Comments:

*The "restconf-server-app-grouping" defines the configuration for a RESTCONF server that supports both listening for connections from RESTCONF clients as well as initiating call-home connections to RESTCONF clients.

*Both the "listen" and "call-home" subtrees must be enabled by "feature" statements.

*For the referenced grouping statement(s):

- The "restconf-server-listen-stack-grouping" grouping is discussed in [Section 3.1.2.2](#) in this document.
- The "restconf-server-callhome-stack-grouping" grouping is discussed in [Section 3.1.2.3](#) in this document.

3.1.3. Protocol-accessible Nodes

The following tree diagram [[RFC8340](#)] lists all the protocol-accessible nodes defined in the "ietf-restconf-server" module:

```
module: ietf-restconf-server
+--rw restconf-server
+---u restconf-server-app-grouping
```

Comments:

*Protocol-accessible nodes are those nodes that are accessible when the module is "implemented", as described in [Section 5.6.5](#) of [[RFC7950](#)].

*For the "ietf-restconf-server" module, the protocol-accessible nodes are an instance of the "restconf-server-app-grouping" discussed in [Section 3.1.2.4](#) grouping.

*The reason for why "restconf-server-app-grouping" exists separate from the protocol-accessible nodes definition is so as to enable instances of restconf-server-app-grouping to be instantiated in other locations, as may be needed or desired by some modules.

3.2. Example Usage

The following example illustrates configuring a RESTCONF server to listen for RESTCONF client connections, as well as configuring call-home to one RESTCONF client.

This example is consistent with the examples presented in [Section 2.2](#) of [[I-D.ietf-netconf-trust-anchors](#)] and [Section 2.2](#) of [[I-D.ietf-netconf-keystore](#)].

===== NOTE: '\' line wrapping per RFC 8792 =====

<CODE ENDS>

4. Security Considerations

4.1. The "ietf-restconf-client" YANG Module

The "ietf-restconf-client" YANG module defines data nodes that are designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC8341](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

None of the readable data nodes in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-all" extension has not been set for any data nodes defined in this module.

None of the writable data nodes in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-write" extension has not been set for any data nodes defined in this module.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

Please be aware that this module uses groupings defined in other RFCs that define data nodes that do set the NACM "default-deny-all" and "default-deny-write" extensions.

4.2. The "ietf-restconf-server" YANG Module

The "ietf-restconf-server" YANG module defines data nodes that are designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC8341](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

None of the readable data nodes in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-all" extension has not been set for any data nodes defined in this module.

None of the writable data nodes in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-write" extension has not been set for any data nodes defined in this module.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

Please be aware that this module uses groupings defined in other RFCs that define data nodes that do set the NACM "default-deny-all" and "default-deny-write" extensions.

5. IANA Considerations

5.1. The "IETF XML" Registry

This document registers two URIs in the "ns" subregistry of the IETF XML Registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registrations are requested:

URI: urn:ietf:params:xml:ns:yang:ietf-restconf-client

Registrant Contact: The IESG

XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-restconf-server

Registrant Contact: The IESG

XML: N/A, the requested URI is an XML namespace.

5.2. The "YANG Module Names" Registry

This document registers two YANG modules in the YANG Module Names registry [[RFC6020](#)]. Following the format in [[RFC6020](#)], the following registrations are requested:

name: ietf-restconf-client
namespace: urn:ietf:params:xml:ns:yang:ietf-restconf-client
prefix: ncc
reference: RFC IIII

name: ietf-restconf-server
namespace: urn:ietf:params:xml:ns:yang:ietf-restconf-server
prefix: ncs
reference: RFC IIII

Appendix A. Change Log

This section is to be removed before publishing as an RFC.

A.1. 00 to 01

*Renamed "keychain" to "keystore".

A.2. 01 to 02

*Filled in previously missing 'ietf-restconf-client' module.

*Updated the ietf-restconf-server module to accommodate new grouping 'ietf-tls-server-grouping'.

A.3. 02 to 03

*Refined use of tls-client-grouping to add a must statement indicating that the TLS client must specify a client-certificate.

*Changed restconf-client??? to be a grouping (not a container).

A.4. 03 to 04

*Added RFC 8174 to Requirements Language Section.

*Replaced refine statement in ietf-restconf-client to add a mandatory true.

*Added refine statement in ietf-restconf-server to add a must statement.

*Now there are containers and groupings, for both the client and server models.

*Now tree diagrams reference ietf-netmod-yang-tree-diagrams

*Updated examples to inline key and certificates (no longer a leafref to keystore)

A.5. 04 to 05

*Now tree diagrams reference ietf-netmod-yang-tree-diagrams

*Updated examples to inline key and certificates (no longer a leafref to keystore)

A.6. 05 to 06

*Fixed change log missing section issue.

*Updated examples to match latest updates to the crypto-types, trust-anchors, and keystore drafts.

*Reduced line length of the YANG modules to fit within 69 columns.

A.7. 06 to 07

*removed "idle-timeout" from "persistent" connection config.

*Added "random-selection" for reconnection-strategy's "starts-with" enum.

*Replaced "connection-type" choice default (persistent) with "mandatory true".

*Reduced the periodic-connection's "idle-timeout" from 5 to 2 minutes.

*Replaced reconnect-timeout with period/anchor-time combo.

A.8. 07 to 08

*Modified examples to be compatible with new crypto-types algs

A.9. 08 to 09

*Corrected use of "mandatory true" for "address" leafs.

*Updated examples to reflect update to groupings defined in the keystore draft.

*Updated to use groupings defined in new TCP and HTTP drafts.

*Updated copyright date, boilerplate template, affiliation, and folding algorithm.

A.10. 09 to 10

*Reformatted YANG modules.

A.11. 10 to 11

*Adjusted for the top-level "demux container" added to groupings imported from other modules.

*Added "must" expressions to ensure that keepalives are not configured for "periodic" connections.

*Updated the boilerplate text in module-level "description" statement to match copyeditor convention.

*Moved "expanded" tree diagrams to the Appendix.

A.12. 11 to 12

*Removed the 'must' statement limiting keepalives in periodic connections.

*Updated models and examples to reflect removal of the "demux" containers in the imported models.

- *Updated the "periodic-connection" description statements to better describe behavior when connections are not closed gracefully.
- *Updated text to better reference where certain examples come from (e.g., which Section in which draft).
- *In the server model, commented out the "must 'pinned-ca-certs or pinned-client-certs'" statement to reflect change made in the TLS draft whereby the trust anchors MAY be defined externally.
- *Replaced the 'listen', 'initiate', and 'call-home' features with boolean expressions.

A.13. 12 to 13

- *Updated to reflect changes in trust-anchors drafts (e.g., s/trust-anchors/truststore/g + s/pinned.//)
- *In ietf-restconf-server, Added 'http-listen' (not https-listen) choice, to support case when server is behind a TLS-terminator.
- *Refactored server module to be more like other 'server' models. If folks like it, will also apply to the client model, as well as to both the netconf client/server models. Now the 'restconf-server-grouping' is just the RC-specific bits (i.e., the "demux" container minus the container), 'restconf-server-[listen|callhome]-stack-grouping' is the protocol stack for a single connection, and 'restconf-server-app-grouping' is effectively what was before (both listen+callhome for many inbound/outbound endpoints).

A.14. 13 to 14

- *Updated examples to reflect ietf-crypto-types change (e.g., identities --> enumerations)
- *Adjusting from change in TLS client model (removing the top-level 'certificate' container).
- *Added "external-endpoint" to the "http-listen" choice in ietf-restconf-server.

A.15. 14 to 15

- *Added missing "or https-listen" clause in a "must" expression.
- *Refactored the client module similar to how the server module was refactored in -13. Now the 'restconf-client-grouping' is just the RC-specific bits, the 'restconf-client-[initiate|listen]-stack-

grouping' is the protocol stack for a single connection, and 'restconf-client-app-grouping' is effectively what was before (both listen+callhome for many inbound/outbound endpoints).

A.16. 15 to 16

- *Added refinement to make "cert-to-name/fingerprint" be mandatory false.

- *Commented out refinement to "tls-server-grouping/client-authentication" until a better "must" expression is defined.

- *Updated restconf-client example to reflect that http-client-grouping no longer has a "protocol-version" leaf.

A.17. 16 to 17

- *Updated examples to include the "-key-format" nodes.

- *Updated examples to remove the "required" nodes.

A.18. 17 to 18

- *Updated examples to reflect new "bag" addition to truststore.

A.19. 18 to 19

- *Updated examples to remove the 'algorithm' nodes.

- *Updated examples to reflect the new TLS keepalives structure.

- *Removed the 'protocol-versions' node from the restconf-server examples.

- *Added a "Note to Reviewers" note to first page.

A.20. 19 to 20

- *Moved and changed "must" statement so that either TLS *or* HTTP auth must be configured.

- *Expanded "Data Model Overview section(s) [remove "wall" of tree diagrams].

- *Updated the Security Considerations section.

A.21. 20 to 21

- *Cleaned up titles in the IANA Considerations section

- *Fixed issues found by the SecDir review of the "keystore" draft.

A.22. 21 to 22

*Addressed comments raised by YANG Doctor in the ct/ts/ks drafts.

A.23. 22 to 23

*Further clarified why some 'presence' statements are present.

*Addressed nits found in YANG Doctor reviews.

*Aligned modules with `pyang -f` formatting.

A.24. 23 to 24

*Removed Appendix A with fully-expanded tree diagrams.

*Replaced "base64encodedvalue==" with "BASE64VALUE=" in examples.

*Minor editorial nits

A.25. 24 to 25

*Fixed up the 'WG Web' and 'WG List' lines in YANG module(s)
