YANG Groupings for SSH Clients and SSH Servers
draft-ietf-netconf-ssh-client-server-22

Abstract

This document defines three YANG modules: the first defines groupings for a generic SSH client, the second defines groupings for a generic SSH server, and the third defines common identities and groupings used by both the client and the server. It is intended that these groupings will be used by applications using the SSH protocol.

Editorial Note (To be removed by RFC Editor)

This draft contains placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

- * "AAAA" --> the assigned RFC value for [draft-ietf-netconf-crypto-types](#)
- * "BBBB" --> the assigned RFC value for [draft-ietf-netconf-trust-anchors](#)
- * "CCCC" --> the assigned RFC value for [draft-ietf-netconf-keystore](#)
- * "DDDD" --> the assigned RFC value for [draft-ietf-netconf-tcp-client-server](#)
- * "EEEE" --> the assigned RFC value for this draft

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

- * "2020-08-20" --> the publication date of this draft

The following Appendix section is to be removed prior to publication:

- * [Appendix A](#). Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 21 February 2021.

1. Introduction

This document defines three YANG 1.1 [[RFC7950](#)] modules: the first defines a grouping for a generic SSH client, the second defines a grouping for a generic SSH server, and the third defines identities and groupings common to both the client and the server. It is intended that these groupings will be used by applications using the SSH protocol [[RFC4252](#)], [[RFC4253](#)], and [[RFC4254](#)]. For instance, these groupings could be used to help define the data model for an OpenSSH [[OPENSSH](#)] server or a NETCONF over SSH [[RFC6242](#)] based server.

The client and server YANG modules in this document each define one grouping, which is focused on just SSH-specific configuration, and specifically avoids any transport-level configuration, such as what ports to listen on or connect to. This affords applications the opportunity to define their own strategy for how the underlying TCP connection is established. For instance, applications supporting NETCONF Call Home [[RFC8071](#)] could use the "ssh-server-grouping" grouping for the SSH parts it provides, while adding data nodes for the TCP-level call-home configuration.

The modules defined in this document use groupings defined in [[I-D.ietf-netconf-keystore](#)] enabling keys to be either locally defined or a reference to globally configured values.

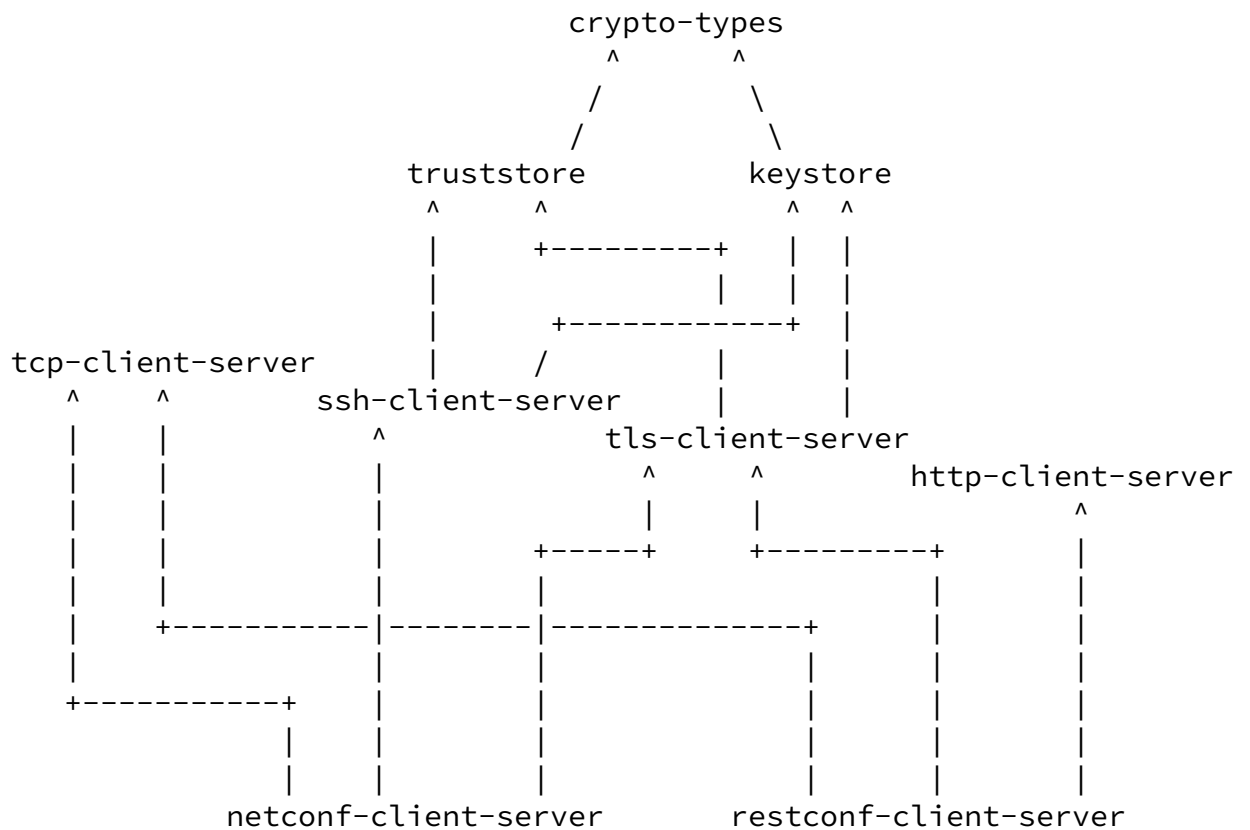

The modules defined in this document optionally support [[RFC6187](#)] enabling X.509v3 certificate based host keys and public keys.

1.1. Relation to other RFCs

This document presents one or more YANG modules [[RFC7950](#)] that are part of a collection of RFCs that work together to define configuration modules for clients and servers of both the NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)] protocols.

The modules have been defined in a modular fashion to enable their use by other efforts, some of which are known to be in progress at the time of this writing, with many more expected to be defined in time.

The normative dependency relationship between the various RFCs in the collection is presented in the below diagram. The labels in the diagram represent the primary purpose provided by each RFC. Hyperlinks to each RFC are provided below the diagram.

Label in Diagram	Originating RFC
crypto-types	[I-D.ietf-netconf-crypto-types]
truststore	[I-D.ietf-netconf-trust-anchors]
keystore	[I-D.ietf-netconf-keystore]
tcp-client-server	[I-D.ietf-netconf-tcp-client-server]
ssh-client-server	[I-D.ietf-netconf-ssh-client-server]
tls-client-server	[I-D.ietf-netconf-tls-client-server]
http-client-server	[I-D.ietf-netconf-http-client-server]
netconf-client-server	[I-D.ietf-netconf-netconf-client-server]
restconf-client-server	[I-D.ietf-netconf-restconf-client-server]

Table 1: Label to RFC Mapping

[1.2.](#) Specification Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

[1.3.](#) Adherence to the NMDA

This document is compliant with the Network Management Datastore Architecture (NMDA) [[RFC8342](#)]. For instance, as described in [[I-D.ietf-netconf-trust-anchors](#)] and [[I-D.ietf-netconf-keystore](#)], trust anchors and keys installed during manufacturing are expected to appear in <operational>.

[2.](#) The "ietf-ssh-common" Module

The SSH common model presented in this section contains identities and groupings common to both SSH clients and SSH servers. The "transport-params-grouping" grouping can be used to configure the list of SSH transport algorithms permitted by the SSH client or SSH server. The lists of algorithms are ordered such that, if multiple algorithms are permitted by the client, the algorithm that appears first in its list that is also permitted by the server is used for the SSH transport layer connection. The ability to restrict the algorithms allowed is provided in this grouping for SSH clients and SSH servers that are capable of doing so and may serve to make SSH clients and SSH servers compliant with security policies.

Features are defined for algorithms that are OPTIONAL or are not widely supported by popular implementations. Note that the list of algorithms is not exhaustive. As well, some algorithms that are REQUIRED by [\[RFC4253\]](#) are missing, notably "ssh-dss" and "diffie-hellman-group1-sha1" due to their weak security and there being alternatives that are widely supported.

[2.1.](#) Data Model Overview

This section provides an overview of the "ietf-ssh-common" module in terms of its features, identities, and groupings.

[2.1.1.](#) Features

The following diagram lists all the "feature" statements defined in the "ietf-ssh-common" module:

Features:

- +-- ssh-ecc
- +-- ssh-x509-certs
- +-- ssh-dh-group-exchange
- +-- ssh-ctr
- +-- ssh-sha2

| The diagram above uses syntax that is similar to but not

| defined in [[RFC8340](#)].

[2.1.2.](#) Identities

The following diagram illustrates the relationship amongst the "identity" statements defined in the "ietf-ssh-common" module:

Identities:

```
+-- public-key-alg-base
|   +-- ssh-dss
|   +-- ssh-rsa
|   +-- ecdsa-sha2-nistp256
|   +-- ecdsa-sha2-nistp384
|   +-- ecdsa-sha2-nistp521
|   +-- x509v3-ssh-rsa
|   +-- x509v3-rsa2048-sha256
|   +-- x509v3-ecdsa-sha2-nistp256
|   +-- x509v3-ecdsa-sha2-nistp384
|   +-- x509v3-ecdsa-sha2-nistp521
+-- key-exchange-alg-base
|   +-- diffie-hellman-group14-sha1
|   +-- diffie-hellman-group-exchange-sha1
|   +-- diffie-hellman-group-exchange-sha256
|   +-- ecdh-sha2-nistp256
|   +-- ecdh-sha2-nistp384
|   +-- ecdh-sha2-nistp521
+-- encryption-alg-base
|   +-- triple-des-cbc
|   +-- aes128-cbc
|   +-- aes192-cbc
|   +-- aes256-cbc
|   +-- aes128-ctr
|   +-- aes192-ctr
|   +-- aes256-ctr
+-- mac-alg-base
|   +-- hmac-sha1
|   +-- hmac-sha2-256
|   +-- hmac-sha2-512
```

| The diagram above uses syntax that is similar to but not

| defined in [[RFC8340](#)].

Comments:

- * The diagram shows that there are four base identities.
- * These identities are used by this module to define algorithms for public-key, key-exchange, encryption, and MACs.
- * These base identities are "abstract", in the object oriented programming sense, in that they only define a "class" of algorithms, rather than a specific algorithm.

[2.1.3](#). Groupings

The following diagram lists all the "grouping" statements defined in the "ietf-ssh-common" module:

Groupings:

```
+-- transport-params-grouping
```

```
| The diagram above uses syntax that is similar to but not  
| defined in [RFC8340].
```

Each of these groupings are presented in the following subsections.

[2.1.3.1](#). The "transport-params-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "transport-params-grouping" grouping:

```
grouping transport-params-grouping  
+-- host-key  
| +-- host-key-alg*  identityref  
+-- key-exchange  
| +-- key-exchange-alg*  identityref  
+-- encryption  
| +-- encryption-alg*  identityref  
+-- mac  
    +-- mac-alg*  identityref
```

Comments:

- * This grouping is used by both the "ssh-client-grouping" and the "ssh-server-grouping" groupings defined in [Section 3.1.2.1](#) and [Section 4.1.2.1](#), respectively.
- * This grouping enables client and server configurations to specify the algorithms that are to be used when establishing SSH sessions.

- * Each list is "ordered-by user".

[2.1.4.](#) Protocol-accessible Nodes

The "ietf-ssh-common" module does not contain any protocol-accessible nodes, but the module needs to be "implemented", as described in [Section 5.6.5 of \[RFC7950\]](#), in order for the identities in [Section 2.1.2](#) to be defined.

[2.2.](#) Example Usage

This following example illustrates how the "transport-params-grouping" grouping appears when populated with some data.

```
<transport-params
  xmlns="urn:ietf:params:xml:ns:yang:ietf-ssh-common"
  xmlns:algs="urn:ietf:params:xml:ns:yang:ietf-ssh-common">
  <host-key>
    <host-key-alg>algs:x509v3-rsa2048-sha256</host-key-alg>
    <host-key-alg>algs:ssh-rsa</host-key-alg>
  </host-key>
  <key-exchange>
    <key-exchange-alg>
      algs:diffie-hellman-group-exchange-sha256
    </key-exchange-alg>
  </key-exchange>
  <encryption>
    <encryption-alg>algs:aes256-ctr</encryption-alg>
    <encryption-alg>algs:aes192-ctr</encryption-alg>
    <encryption-alg>algs:aes128-ctr</encryption-alg>
    <encryption-alg>algs:aes256-cbc</encryption-alg>
    <encryption-alg>algs:aes192-cbc</encryption-alg>
    <encryption-alg>algs:aes128-cbc</encryption-alg>
  </encryption>
  <mac>
    <mac-alg>algs:hmac-sha2-256</mac-alg>
    <mac-alg>algs:hmac-sha2-512</mac-alg>
  </mac>
</transport-params>
```

[2.3.](#) YANG Module

This YANG module has normative references to [\[RFC4253\]](#), [\[RFC4344\]](#), [\[RFC4419\]](#), [\[RFC5656\]](#), [\[RFC6187\]](#), and [\[RFC6668\]](#).

<CODE ENDS>

3. The "ietf-ssh-client" Module

This section defines a YANG 1.1 [[RFC7950](#)] module called "ietf-ssh-client". A high-level overview of the module is provided in [Section 3.1](#). Examples illustrating the module's use are provided in Examples ([Section 3.2](#)). The YANG module itself is defined in [Section 3.3](#).

3.1. Data Model Overview

This section provides an overview of the "ietf-ssh-client" module in terms of its features and groupings.

3.1.1. Features

The following diagram lists all the "feature" statements defined in the "ietf-ssh-client" module:

Features:

```
+-- ssh-client-transport-params-config  
+-- ssh-client-keepalives  
+-- client-identity-password  
+-- client-identity-publickey  
+-- client-identity-hostbased  
+-- client-identity-none
```

| The diagram above uses syntax that is similar to but not
| defined in [[RFC8340](#)].

3.1.2. Groupings

The following diagram lists all the "grouping" statements defined in

the "ietf-ssh-client" module:

Groupings:

```
+-- ssh-client-grouping
```

```
| The diagram above uses syntax that is similar to but not
| defined in [RFC8340].
```

Each of these groupings are presented in the following subsections.

[3.1.2.1](#). The "ssh-client-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "ssh-client-grouping" grouping:

===== NOTE: '\ ' line wrapping per [RFC 8792](#) =====

```
grouping ssh-client-grouping
+-- client-identity
|  +-- username?      string
|  +-- public-key! {client-identity-publickey}?
|  |  +---u ks:local-or-keystore-asymmetric-key-grouping
|  +-- password! {client-identity-password}?
|  |  +---u ct:password-grouping
|  +-- hostbased! {client-identity-hostbased}?
|  |  +---u ks:local-or-keystore-asymmetric-key-grouping
|  +-- none?          empty {client-identity-none}?
```

```

    | +-- certificate! {sshcmn:ssh-x509-certs}?
    |   +---u ks:local-or-keystore-end-entity-cert-with-key-groupi\
ng
+-- server-authentication
| +-- ssh-host-keys!
| | +---u ts:local-or-truststore-public-keys-grouping
| +-- ca-certs! {sshcmn:ssh-x509-certs}?
| | +---u ts:local-or-truststore-certs-grouping
| +-- ee-certs! {sshcmn:ssh-x509-certs}?
|   +---u ts:local-or-truststore-certs-grouping
+-- transport-params {ssh-client-transport-params-config}?
| +---u sshcmn:transport-params-grouping
+-- keepalives! {ssh-client-keepalives}?
    +-- max-wait?      uint16
    +-- max-attempts? uint8

```

Comments:

- * The "client-identity" node configures a "username" and credentials, each enabled by a "feature" statement defined in [Section 3.1.1](#).
- * The "server-authentication" node configures trust anchors for authenticating the SSH server, with each option enabled by a "feature" statement.
- * The "transport-params" node, which must be enabled by a feature, configures parameters for the SSH sessions established by this configuration.
- * The "keepalives" node, which must be enabled by a feature, configures a "presence" container for testing the aliveness of the SSH server. The aliveness-test occurs at the SSH protocol layer.
- * For the referenced grouping statement(s):

- The "local-or-keystore-asymmetric-key-grouping" grouping is discussed in Section 2.1.3.4 of [[I-D.ietf-netconf-keystore](#)].
- The "local-or-keystore-end-entity-cert-with-key-grouping" grouping is discussed in Section 2.1.3.6 of [[I-D.ietf-netconf-keystore](#)].

- The "local-or-truststore-public-keys-grouping" grouping is discussed in Section 2.1.3.2 of [\[I-D.ietf-netconf-trust-anchors\]](#).
- The "local-or-truststore-certs-grouping" grouping is discussed in Section 2.1.3.1 of [\[I-D.ietf-netconf-trust-anchors\]](#).
- The "transport-params-grouping" grouping is discussed in [Section 2.1.3.1](#) in this document.

3.2. Example Usage

This section presents two examples showing the "ssh-client-grouping" grouping populated with some data. These examples are effectively the same except the first configures the client identity using a local key while the second uses a key configured in a keystore. Both examples are consistent with the examples presented in Section 2 of [\[I-D.ietf-netconf-trust-anchors\]](#) and [Section 3.2](#) of [\[I-D.ietf-netconf-keystore\]](#).

The following configuration example uses local-definitions for the client identity and server authentication:

===== NOTE: '\ ' line wrapping per [RFC 8792](#) =====

```
<ssh-client
  xmlns="urn:ietf:params:xml:ns:yang:ietf-ssh-client"
  xmlns:ct="urn:ietf:params:xml:ns:yang:ietf-crypto-types"
  xmlns:algs="urn:ietf:params:xml:ns:yang:ietf-ssh-common">

  <!-- how this client will authenticate itself to the server -->
  <client-identity>
    <username>foobar</username>
    <public-key>
      <local-definition>
        <public-key-format>ct:ssh-public-key-format</public-key-format>
      </local-definition>
      <public-key>base64encodedvalue==</public-key>
      <private-key-format>ct:rsa-private-key-format</private-key-format>
      <cleartext-private-key>base64encodedvalue==</cleartext-private-key>
    </public-key>
  </client-identity>
```

```

<!-- which host keys will this client trust -->
<server-authentication>
  <ssh-host-keys>
    <local-definition>
      <public-key>
        <name>corp-fw1</name>
        <public-key-format>ct:ssh-public-key-format</public-key-fo\
rmat>
        <public-key>base64encodedvalue==</public-key>
      </public-key>
      <public-key>
        <name>corp-fw2</name>
        <public-key-format>ct:ssh-public-key-format</public-key-fo\
rmat>
        <public-key>base64encodedvalue==</public-key>
      </public-key>
    </local-definition>
  </ssh-host-keys>
  <ca-certs>
    <local-definition>
      <certificate>
        <name>Server Cert Issuer #1</name>
        <cert-data>base64encodedvalue==</cert-data>
      </certificate>
      <certificate>
        <name>Server Cert Issuer #2</name>
        <cert-data>base64encodedvalue==</cert-data>
      </certificate>
    </local-definition>
  </ca-certs>
  <ee-certs>
    <local-definition>
      <certificate>
        <name>My Application #1</name>
        <cert-data>base64encodedvalue==</cert-data>
      </certificate>
      <certificate>
        <name>My Application #2</name>
        <cert-data>base64encodedvalue==</cert-data>
      </certificate>
    </local-definition>
  </ee-certs>
</server-authentication>

<keepalives>
  <max-wait>30</max-wait>
  <max-attempts>3</max-attempts>
</keepalives>

```

</ssh-client>

The following configuration example uses keystore-references for the client identity and truststore-references for server authentication: from the keystore:

===== NOTE: '\ ' line wrapping per [RFC 8792](#) =====

```
<ssh-client
  xmlns="urn:ietf:params:xml:ns:yang:ietf-ssh-client"
  xmlns:algs="urn:ietf:params:xml:ns:yang:ietf-ssh-common">

  <!-- how this client will authenticate itself to the server -->
  <client-identity>
    <username>foobar</username>
    <!-- can an SSH client have more than one key?
    <public-key>
      <keystore-reference>ssh-rsa-key</keystore-reference>
    </public-key>
    -->
    <certificate>
      <keystore-reference>
        <asymmetric-key>ssh-rsa-key-with-cert</asymmetric-key>
        <certificate>ex-rsa-cert2</certificate>
      </keystore-reference>
    </certificate>
  </client-identity>

  <!-- which host-keys will this client trust -->
  <server-authentication>
    <ssh-host-keys>
      <truststore-reference>trusted-ssh-public-keys</truststore-refe\
rence>
    </ssh-host-keys>
    <ca-certs>
      <truststore-reference>trusted-server-ca-certs</truststore-refe\
rence>
    </ca-certs>
    <ee-certs>
      <truststore-reference>trusted-server-ee-certs</truststore-refe\
rence>
```

```
</ee-certs>
</server-authentication>

<keepalives>
  <max-wait>30</max-wait>
  <max-attempts>3</max-attempts>
</keepalives>

</ssh-client>
```

<CODE ENDS>

4. The "ietf-ssh-server" Module

This section defines a YANG 1.1 [\[RFC7950\]](#) module called "ietf-ssh-server". A high-level overview of the module is provided in [Section 4.1](#). Examples illustrating the module's use are provided in Examples ([Section 4.2](#)). The YANG module itself is defined in [Section 4.3](#).

4.1. Data Model Overview

This section provides an overview of the "ietf-ssh-server" module in terms of its features and groupings.

4.1.1. Features

The following diagram lists all the "feature" statements defined in the "ietf-ssh-server" module:

Features:

```
+-- ssh-server-transport-params-config
+-- ssh-server-keepalives
+-- client-auth-config-supported
+-- client-auth-publickey
+-- client-auth-password
+-- client-auth-hostbased
+-- client-auth-none
```

| The diagram above uses syntax that is similar to but not
| defined in [[RFC8340](#)].

[4.1.2](#). Groupings

The following diagram lists all the "grouping" statements defined in the "ietf-ssh-server" module:

Watsen

Groupings for SSH Clients and Servers

August 2020

Groupings:

```
+-- ssh-server-grouping
```

| The diagram above uses syntax that is similar to but not
| defined in [[RFC8340](#)].

Each of these groupings are presented in the following subsections.

[4.1.2.1](#). The "ssh-server-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "ssh-server-grouping" grouping:

=====
===== NOTE: '\ ' line wrapping per [RFC 8792](#) =====

```
grouping ssh-server-grouping
  +-- server-identity
  |   +-- host-key* [name]
  |       +-- name?                string
  |       +-- (host-key-type)
  |           +--:(public-key)
  |               |   +-- public-key
  |                   |   +---u ks:local-or-keystore-asymmetric-key-grouping
  |           +--:(certificate)
  |               +-- certificate {sshcmn:ssh-x509-certs}?
  |                   +---u ks:local-or-keystore-end-entity-cert-with-k\
ey-grouping
  +-- client-authentication
```

```

| +-- supported-authentication-methods
| | +-- publickey?    empty
| | +-- password?    empty {client-auth-password}?
| | +-- hostbased?   empty {client-auth-hostbased}?
| | +-- none?        empty {client-auth-none}?
| +-- users {client-auth-config-supported}?
| | +-- user* [name]
| | | +-- name?          string
| | | +-- public-keys! {client-auth-publickey}?
| | | | +---u ts:local-or-truststore-public-keys-grouping
| | | +-- password?    ianach:crypt-hash
| | | | {client-auth-password}?
| | | +-- hostbased! {client-auth-hostbased}?
| | | | +---u ts:local-or-truststore-public-keys-grouping
| | | +-- none?        empty {client-auth-none}?
| +-- ca-certs!
| | {client-auth-config-supported,sshcmn:ssh-x509-certs}?
| | +---u ts:local-or-truststore-certs-grouping
| +-- ee-certs!
| | {client-auth-config-supported,sshcmn:ssh-x509-certs}?
| | +---u ts:local-or-truststore-certs-grouping
+-- transport-params {ssh-server-transport-params-config}?
| +---u sshcmn:transport-params-grouping
+-- keepalives! {ssh-server-keepalives}?
    +-- max-wait?      uint16
    +-- max-attempts?  uint8

```

Comments:

- * The "server-identity" node configures identity credentials. The ability to use a certificate is enabled by a "feature".

- * The "client-authentication" node configures trust anchors for authenticating the SSH client, with each option enabled by a "feature" statement.
- * The "transport-params" node, which must be enabled by a feature, configures parameters for the SSH sessions established by this configuration.

- * The "keepalives" node, which must be enabled by a feature, configures a "presence" container for testing the aliveness of the SSH client. The aliveness-test occurs at the SSH protocol layer.
- * For the referenced grouping statement(s):
 - The "local-or-keystore-asymmetric-key-grouping" grouping is discussed in Section 2.1.3.4 of [[I-D.ietf-netconf-keystore](#)].
 - The "local-or-keystore-end-entity-cert-with-key-grouping" grouping is discussed in Section 2.1.3.6 of [[I-D.ietf-netconf-keystore](#)].
 - The "local-or-truststore-public-keys-grouping" grouping is discussed in Section 2.1.3.2 of [[I-D.ietf-netconf-trust-anchors](#)].
 - The "local-or-truststore-certs-grouping" grouping is discussed in Section 2.1.3.1 of [[I-D.ietf-netconf-trust-anchors](#)].
 - The "transport-params-grouping" grouping is discussed in [Section 2.1.3.1](#) in this document.

4.2. Example Usage

This section presents two examples showing the "ssh-server-grouping" grouping populated with some data. These examples are effectively the same except the first configures the server identity using a local key while the second uses a key configured in a keystore. Both examples are consistent with the examples presented in Section 2 of [[I-D.ietf-netconf-trust-anchors](#)] and [Section 3.2](#) of [[I-D.ietf-netconf-keystore](#)].

The following configuration example uses local-definitions for the server identity and client authentication:

===== NOTE: '\ ' line wrapping per [RFC 8792](#) =====

```
<ssh-server
  xmlns="urn:ietf:params:xml:ns:yang:ietf-ssh-server"
  xmlns:ct="urn:ietf:params:xml:ns:yang:ietf-crypto-types"
  xmlns:algs="urn:ietf:params:xml:ns:yang:ietf-ssh-common">

  <!-- the host-key this SSH server will present -->
```

```
<server-identity>
```

```

    <host-key>
      <name>my-pubkey-based-host-key</name>
      <public-key>
        <local-definition>
          <public-key-format>ct:ssh-public-key-format</public-key-fo\
rmat>
          <public-key>base64encodedvalue==</public-key>
          <private-key-format>ct:rsa-private-key-format</private-key\
-format>
          <cleartext-private-key>base64encodedvalue==</cleartext-pri\
vate-key>

    <supported-authentication-methods>
      <publickey/>
    </supported-authentication-methods>
    <users>
      <user>
        <name>mary</name>
        <password>$0$secret</password>
        <public-keys>
          <local-definition>
            <!--<ssh-public-key>-->
            <public-key>
              <name>User A</name>
              <public-key-format>ct:ssh-public-key-format</public-ke\
y-format>

```

```
        <public-key>base64encodedvalue==</public-key>
        <!--</ssh-public-key>
<ssh-public-key>-->
</public-key>
<public-key>
  <name>User B</name>
  <public-key-format>ct:ssh-public-key-format</public-key-
y-format>
  <public-key>base64encodedvalue==</public-key>
</public-key>
  <!--</ssh-public-key>-->
</local-definition>
</public-keys>
</user>
</users>
<ca-certs>
  <local-definition>
    <certificate>
      <name>Identity Cert Issuer #1</name>
      <cert-data>base64encodedvalue==</cert-data>
    </certificate>
    <certificate>
      <name>Identity Cert Issuer #2</name>
      <cert-data>base64encodedvalue==</cert-data>
    </certificate>
  </local-definition>
</ca-certs>
<ee-certs>
  <local-definition>
    <certificate>
      <name>Application #1</name>
      <cert-data>base64encodedvalue==</cert-data>
    </certificate>
    <certificate>
      <name>Application #2</name>
      <cert-data>base64encodedvalue==</cert-data>
    </certificate>
  </local-definition>
</ee-certs>
</client-authentication>

<keepalives>
  <max-wait>30</max-wait>
  <max-attempts>3</max-attempts>
</keepalives>
```

</ssh-server>

The following configuration example uses keystore-references for the server identity and truststore-references for client authentication: from the keystore:

===== NOTE: '\ ' line wrapping per [RFC 8792](#) =====

```
<ssh-server
  xmlns="urn:ietf:params:xml:ns:yang:ietf-ssh-server"
  xmlns:algs="urn:ietf:params:xml:ns:yang:ietf-ssh-common">

<CODE ENDS>

[5.](#) Security Considerations

[5.1.](#) The "ietf-ssh-common" YANG Module

The "ietf-ssh-common" YANG module defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC8341](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

None of the readable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-all" extension has not been set for any data nodes defined in this module.

None of the writable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-write" extension has not been set for any data nodes

defined in this module.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

5.2. The "ietf-ssh-client" YANG Module

The "ietf-ssh-client" YANG module defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC8341](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

One readable data node defined in this YANG module may be considered sensitive or vulnerable in some network environments. This node is as follows:

* The "client-identity/password" node:

The cleartext "password" node defined in the "ssh-client-grouping" grouping is additionally sensitive to read operations such that, in normal use cases, it should never be returned to a client. For this reason, the NACM extension "default-deny-all" has been applied to it.

| Please be aware that this module uses the "key" and "private-
| key" nodes from the "ietf-crypto-types" module
| [[I-D.ietf-netconf-crypto-types](#)], where said nodes have the NACM
| extension "default-deny-all" set, thus preventing unrestricted
| read-access to the cleartext key values.

All of the writable data nodes defined by this module may be considered sensitive or vulnerable in some network environments. For instance, any modification to a key or reference to a key may dramatically alter the implemented security policy. For this reason, the NACM extension "default-deny-write" has been set for all data nodes defined in this module.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

[5.3.](#) The "ietf-ssh-server" YANG Module

The "ietf-ssh-server" YANG module defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC8341](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

None of the readable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-all" extension has not been set for any data nodes defined in this module.

| Please be aware that this module uses the "key" and "private-
| key" nodes from the "ietf-crypto-types" module
| [[I-D.ietf-netconf-crypto-types](#)], where said nodes have the NACM
| extension "default-deny-all" set, thus preventing unrestricted
| read-access to the cleartext key values.

All of the writable data nodes defined by this module may be considered sensitive or vulnerable in some network environments. For instance, the addition or removal of references to keys, certificates, trusted anchors, etc., or even the modification of transport or keepalive parameters can dramatically alter the

implemented security policy. For this reason, the NACM extension "default-deny-write" has been set for all data nodes defined in this module.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

[6.](#) IANA Considerations

[6.1.](#) The "IETF XML" Registry

This document registers three URIs in the "ns" subregistry of the IETF XML Registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registrations are requested:

URI: urn:ietf:params:xml:ns:yang:ietf-ssh-common
Registrant Contact: The NETCONF WG of the IETF.
XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-ssh-client
Registrant Contact: The NETCONF WG of the IETF.
XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-ssh-server
Registrant Contact: The NETCONF WG of the IETF.
XML: N/A, the requested URI is an XML namespace.

[6.2.](#) The "YANG Module Names" Registry

This document registers three YANG modules in the YANG Module Names registry [[RFC6020](#)]. Following the format in [[RFC6020](#)], the following registrations are requested:

name: ietf-ssh-common
namespace: urn:ietf:params:xml:ns:yang:ietf-ssh-common
prefix: sshcmn
reference: RFC EEEE

name: ietf-ssh-client
namespace: urn:ietf:params:xml:ns:yang:ietf-ssh-client
prefix: sshc
reference: RFC EEEE

name: ietf-ssh-server
namespace: urn:ietf:params:xml:ns:yang:ietf-ssh-server
prefix: sshs
reference: RFC EEEE

[Appendix A](#). Change Log

This section is to be removed before publishing as an RFC.

[A.1.](#) 00 to 01

- * Noted that '0.0.0.0' and ':::' might have special meanings.
- * Renamed "keychain" to "keystore".

[A.2.](#) 01 to 02

- * Removed the groupings 'listening-ssh-client-grouping' and 'listening-ssh-server-grouping'. Now modules only contain the transport-independent groupings.
- * Simplified the "client-auth" part in the ietf-ssh-client module. It now inlines what it used to point to keystore for.
- * Added cipher suites for various algorithms into new 'ietf-ssh-common' module.

[A.3.](#) 02 to 03

- * Removed 'RESTRICTED' enum from 'password' leaf type.
- * Added a 'must' statement to container 'server-auth' asserting that at least one of the various auth mechanisms must be specified.
- * Fixed description statement for leaf 'trusted-ca-certs'.

[A.4.](#) 03 to 04

- * Change title to "YANG Groupings for SSH Clients and SSH Servers"
- * Added reference to [RFC 6668](#)
- * Added [RFC 8174](#) to Requirements Language Section.
- * Enhanced description statement for ietf-ssh-server's "trusted-ca-certs" leaf.
- * Added mandatory true to ietf-ssh-client's "client-auth" 'choice' statement.

- * Changed the YANG prefix for module ietf-ssh-common from 'sshcom' to 'sshcmn'.
- * Removed the compression algorithms as they are not commonly configurable in vendors' implementations.
- * Updating descriptions in transport-params-grouping and the servers's usage of it.
- * Now tree diagrams reference ietf-netmod-yang-tree-diagrams
- * Updated YANG to use typedefs around leafrefs to common keystore paths
- * Now inlines key and certificates (no longer a leafref to keystore)

[A.5.](#) 04 to 05

- * Merged changes from co-author.

[A.6.](#) 05 to 06

- * Updated to use trust anchors from trust-anchors draft (was keystore draft)
- * Now uses new keystore grouping enabling asymmetric key to be either locally defined or a reference to the keystore.

[A.7.](#) 06 to 07

- * factored the ssh-[client|server]-groupings into more reusable groupings.

- * added if-feature statements for the new "ssh-host-keys" and "x509-certificates" features defined in [draft-ietf-netconf-trust-anchors](#).

[A.8.](#) 07 to 08

- * Added a number of compatibility matrices to [Section 5](#) (thanks

Frank!)

- * Clarified that any configured "host-key-alg" values need to be compatible with the configured private key.

[A.9.](#) 08 to 09

- * Updated examples to reflect update to groupings defined in the keystore -09 draft.
- * Add SSH keepalives features and groupings.
- * Prefixed top-level SSH grouping nodes with 'ssh-' and support mashups.
- * Updated copyright date, boilerplate template, affiliation, and folding algorithm.

[A.10.](#) 09 to 10

- * Reformatted the YANG modules.

[A.11.](#) 10 to 11

- * Reformatted lines causing folding to occur.

[A.12.](#) 11 to 12

- * Collapsed all the inner groupings into the top-level grouping.
- * Added a top-level "demux container" inside the top-level grouping.
- * Added NACM statements and updated the Security Considerations section.
- * Added "presence" statements on the "keepalive" containers, as was needed to address a validation error that appeared after adding the "must" statements into the NETCONF/RESTCONF client/server modules.

- * Updated the boilerplate text in module-level "description" statement to match copyeditor convention.

[A.13.](#) 12 to 13

- * Removed the "demux containers", floating the nacm:default-deny-write to each descendent node, and adding a note to model designers regarding the potential need to add their own demux containers.
- * Fixed a couple references ([section 2](#) --> [section 3](#))
- * In the server model, replaced <client-cert-auth> with <client-authentication> and introduced 'local-or-external' choice.

[A.14.](#) 13 to 14

- * Updated to reflect changes in trust-anchors drafts (e.g., s/trust-anchors/truststore/g + s/pinned.//)

[A.15.](#) 14 to 15

- * Updated examples to reflect ietf-crypto-types change (e.g., identities --> enumerations)
- * Updated "server-authentication" and "client-authentication" nodes from being a leaf of type "ts:host-keys-ref" or "ts:certificates-ref" to a container that uses "ts:local-or-truststore-host-keys-grouping" or "ts:local-or-truststore-certs-grouping".

[A.16.](#) 15 to 16

- * Removed unnecessary if-feature statements in the -client and -server modules.
- * Cleaned up some description statements in the -client and -server modules.
- * Fixed a canonical ordering issue in ietf-ssh-common detected by new pyang.

[A.17.](#) 16 to 17

- * Removed choice local-or-external by removing the 'external' case and flattening the 'local' case and adding a "client-auth-config-supported" feature.
- * Updated examples to include the "*-key-format" nodes.

Internet-Draft Groupings for SSH Clients and Servers August 2020

- * Augmented-in "must" expressions ensuring that locally-defined public-key-format are "ct:ssh-public-key-format" (must expr for ref'ed keys are TBD).

[A.18.](#) 17 to 18

- * Removed leaf-list 'other' from ietf-ssh-server.
- * Removed unused 'external-client-auth-supported' feature.
- * Added features client-auth-password, client-auth-hostbased, and client-auth-none.
- * Renamed 'host-key' to 'public-key' for when referring to 'publickey' based auth.
- * Added new feature-protected 'hostbased' and 'none' to the 'user' node's config.
- * Added new feature-protected 'hostbased' and 'none' to the 'client-identity' node's config.
- * Updated examples to reflect new "bag" addition to truststore.
- * Refined truststore/keystore groupings to ensure the key formats "must" be particular values.
- * Switched to using truststore's new "public-key" bag (instead of separate "ssh-public-key" and "raw-public-key" bags).
- * Updated client/server examples to cover ALL cases (local/ref x cert/raw-key/psk).

[A.19.](#) 18 to 19

- * Updated the "keepalives" containers to address Michal Vasko's request to align with [RFC 8071](#).
- * Removed algorithm-mapping tables from the "SSH Common Model" section
- * Removed 'algorithm' node from examples.

- * Added feature "client-identity-publickey"
- * Removed "choice auth-type", as auth-types aren't exclusive.
- * Renamed both "client-certs" and "server-certs" to "ee-certs"

Watsen

[Page 60]

Internet-Draft

Groupings for SSH Clients and Servers

August 2020

- * Switch "must" to assert the public-key-format is "subject-public-key-info-format" when certificates are used.
- * Added a "Note to Reviewers" note to first page.

[A.20.](#) 19 to 20

- * Added a "must 'public-key or password or hostbased or none or certificate'" statement to the "user" node in ietf-ssh-client
- * Expanded "Data Model Overview section(s) [remove "wall" of tree diagrams].
- * Moved the "ietf-ssh-common" module section to proceed the other two module sections.
- * Updated the Security Considerations section.

[A.21.](#) 20 to 21

- * Updated examples to reflect new "cleartext-" prefix in the crypto-types draft.

[A.22.](#) 21 to 22

- * Cleaned up the SSH-client examples (i.e., removing FIXMEs)
- * Fixed issues found by the SecDir review of the "keystore" draft.
- * Updated the "ietf-ssh-client" module to use the new "password-grouping" grouping from the "crypto-types" module.

Acknowledgements

The authors would like to thank for following for lively discussions on list and in the halls (ordered by first name): Alan Luchuk, Andy

Bierman, Balazs Kovacs, Benoit Claise, Bert Wijnen, David Lamparter, Gary Wu, Juergen Schoenwaelder, Ladislav Lhotka, Liang Xia, Martin Bjorklund, Mehmet Ersue, Michal Vasko, Phil Shafer, Radek Krejci, Sean Turner, Tom Petch.

Special acknowledgement goes to Gary Wu who contributed the "ietf-ssh-common" module.
