YANG Groupings for TCP Clients and TCP Servers  
draft-ietf-netconf-tcp-client-server-12

Abstract

This document defines three YANG 1.1 modules to support the configuration of TCP clients and TCP servers. The modules include basic parameters of a TCP connection relevant for client or server applications, as well as client configuration required for traversing proxies. The modules can be used either standalone or in conjunction with configuration of other stack protocol layers.

Editorial Note (To be removed by RFC Editor)

This draft contains placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

- \* AAAA --> the assigned RFC value for [draft-ietf-netconf-crypto-types](#)
- \* DDDD --> the assigned RFC value for this draft

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

- \* 2022-03-07 --> the publication date of this draft

The following Appendix section is to be removed prior to publication:

- \* [Appendix A](#). Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

## Internet-Draft Groupings for TCP Clients and Servers

March 2022

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 8 September 2022.

## Copyright Notice

## [1.](#) Introduction

This document defines three YANG 1.1 [[RFC7950](#)] modules to support the configuration of TCP clients and TCP servers (TCP is defined in [[RFC0793](#)]), either as standalone or in conjunction with configuration of other stack protocol layers.

The modules focus on three different types of base TCP parameters that matter for TCP-based applications: First, the modules cover fundamental configuration of a TCP client or TCP server application, such as addresses and port numbers. Second, a reusable grouping enables modification of application-specific parameters for a TCP connections, such as use of TCP keep-alives. And third, client

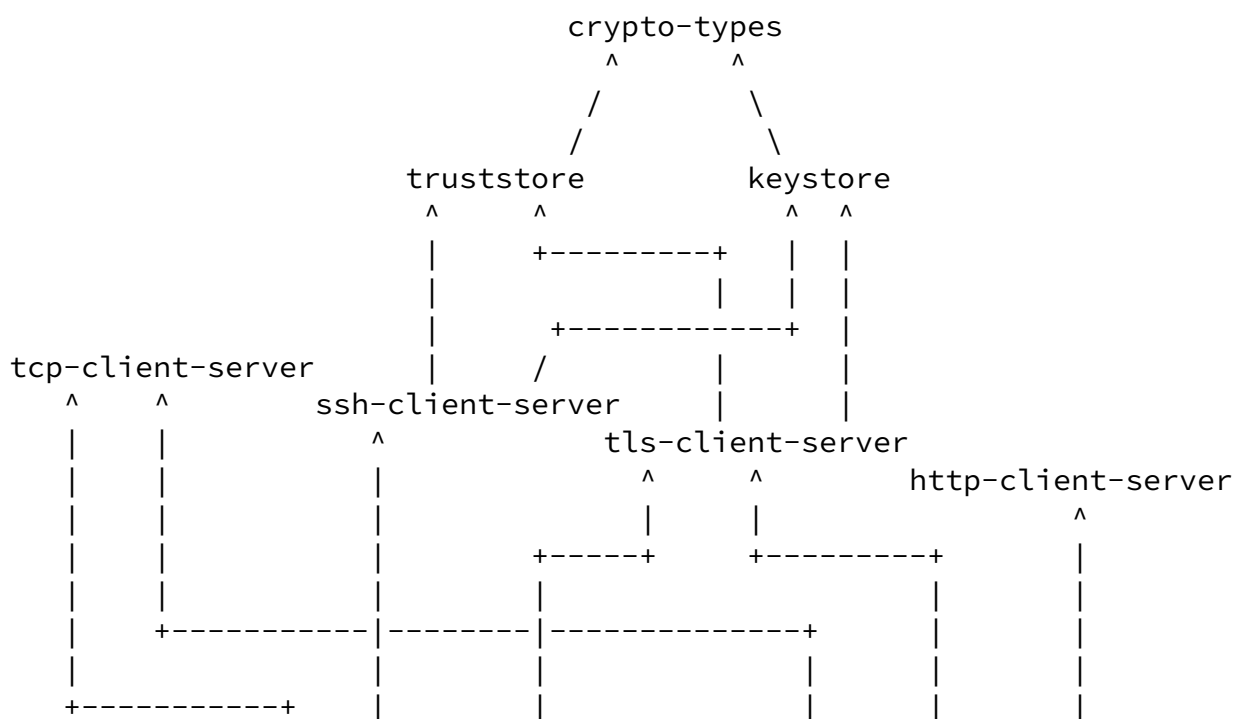

configuration for traversing proxies is included as well. In each case, the modules have a very narrow scope and focus on a minimum set of required parameters.

### [1.1.](#) Relation to other RFCs

This document presents one or more YANG modules [[RFC7950](#)] that are part of a collection of RFCs that work together to, ultimately, enable the configuration of the clients and servers of both the NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)] protocols.

The modules have been defined in a modular fashion to enable their use by other efforts, some of which are known to be in progress at the time of this writing, with many more expected to be defined in time.

The normative dependency relationship between the various RFCs in the collection is presented in the below diagram. The labels in the diagram represent the primary purpose provided by each RFC. Hyperlinks to each RFC are provided below the diagram.

Label in Diagram	Originating RFC
crypto-types	<a href="#">[I-D.ietf-netconf-crypto-types]</a>
truststore	<a href="#">[I-D.ietf-netconf-trust-anchors]</a>
keystore	<a href="#">[I-D.ietf-netconf-keystore]</a>
tcp-client-server	<a href="#">[I-D.ietf-netconf-tcp-client-server]</a>
ssh-client-server	<a href="#">[I-D.ietf-netconf-ssh-client-server]</a>
tls-client-server	<a href="#">[I-D.ietf-netconf-tls-client-server]</a>
http-client-server	<a href="#">[I-D.ietf-netconf-http-client-server]</a>
netconf-client-server	<a href="#">[I-D.ietf-netconf-netconf-client-server]</a>
restconf-client-server	<a href="#">[I-D.ietf-netconf-restconf-client-server]</a>

## Table 1: Label to RFC Mapping

### [1.2.](#) Specification Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

### [1.3.](#) Adherence to the NMDA

This document is compliant with the Network Management Datastore Architecture (NMDA) [[RFC8342](#)]. It does not define any protocol accessible nodes that are "config false".

### [1.4.](#) Conventions

Various examples used in this document use a placeholder value for binary data that has been base64 encoded (e.g., "BASE64VALUE="). This placeholder value is used as real base64 encoded structures are often many lines long and hence distracting to the example being presented.

## [2.](#) The "ietf-tcp-common" Module

This section defines a YANG 1.1 module called "ietf-tcp-common". A high-level overview of the module is provided in [Section 2.1](#). Examples illustrating the module's use are provided in Examples ([Section 2.2](#)). The YANG module itself is defined in [Section 2.3](#).

### [2.1.](#) Data Model Overview

This section provides an overview of the "ietf-tcp-common" module in terms of its features and groupings.

#### [2.1.1.](#) Model Scope

This document defines a common "grouping" statement for basic TCP

connection parameters that matter to applications. In some TCP stacks, such parameters can also directly be set by an application using system calls, such as the sockets API. The base YANG model in this document focuses on modeling TCP keep-alives. This base model can be extended as needed.

### [2.1.2.](#) Features

The following diagram lists all the "feature" statements defined in the "ietf-tcp-common" module:

Features:

+++ keepalives-supported

| The diagram above uses syntax that is similar to but not  
| defined in [[RFC8340](#)].

### [2.1.3.](#) Groupings

The "ietf-tcp-common" module defines the following "grouping" statement:

\* tcp-common-grouping

This grouping is presented in the following subsection.

#### [2.1.3.1.](#) The "tcp-common-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "tcp-common-grouping" grouping:

```
grouping tcp-common-grouping
  +-+ keepalives! {keepalives-supported}?
    +-+ idle-time          uint16
    +-+ max-probes         uint16
    +-+ probe-interval     uint16
```

Comments:

- \* The "keepalives" node is a "presence" node so that the mandatory descendant nodes do not imply that keepalives must be configured.
- \* The "idle-time", "max-probes", and "probe-interval" nodes have the common meanings. Please see the YANG module in [Section 2.3](#) for details.

#### [2.1.4.](#) Protocol-accessible Nodes

The "ietf-tcp-common" module defines only "grouping" statements that are used by other modules to instantiate protocol-accessible nodes.

#### [2.1.5.](#) Guidelines for Configuring TCP Keep-Alives

Network stacks may include "keep-alives" in their TCP implementations, although this practice is not universally accepted. If keep-alives are included, [\[RFC1122\]](#) mandates that the application MUST be able to turn them on or off for each TCP connection, and that they MUST default to off.

Keep-alive mechanisms exist in many protocols. Depending on the protocol stack, TCP keep-alives may only be one out of several alternatives. Which mechanism(s) to use depends on the use case and application requirements. If keep-alives are needed by an application, it is RECOMMENDED that the aliveness check happens only at the protocol layers that are meaningful to the application.

A TCP keep-alive mechanism SHOULD only be invoked in server applications that might otherwise hang indefinitely and consume resources unnecessarily if a client crashes or aborts a connection during a network failure [\[RFC1122\]](#). TCP keep-alives may consume significant resources both in the network and in endpoints (e.g., battery power). In addition, frequent keep-alives risk network congestion. The higher the frequency of keep-alives, the higher the overhead.

Given the cost of keep-alives, parameters have to be configured carefully:

- \* The default idle interval (leaf "idle-time") MUST default to no

less than two hours, i.e., 7200 seconds [[RFC1122](#)]. A lower value MAY be configured, but keep-alive messages SHOULD NOT be transmitted more frequently than once every 15 seconds. Longer intervals SHOULD be used when possible.

- \* The maximum number of sequential keep-alive probes that can fail (leaf "max-probes") trades off responsiveness and robustness against packet loss. ACK segments that contain no data are not reliably transmitted by TCP. Consequently, if a keep-alive mechanism is implemented it MUST NOT interpret failure to respond to any specific probe as a dead connection [[RFC1122](#)]. Typically, a single-digit number should suffice.
- \* TCP implementations may include a parameter for the number of seconds between TCP keep-alive probes (leaf "probe-interval"). In order to avoid congestion, the time interval between probes MUST NOT be smaller than one second. Significantly longer intervals SHOULD be used. It is important to note that keep-alive probes (or replies) can get dropped due to network congestion. Sending further probe messages into a congested path after a short interval, without backing off timers, could cause harm and result in a congestion collapse. Therefore it is essential to pick a large, conservative value for this interval.

## [2.2.](#) Example Usage

This section presents an example showing the "tcp-common-grouping" populated with some data.

```
<!-- The outermost element below doesn't exist in the data model. -->
<!-- It simulates if the "grouping" were a "container" instead. -->

<tcp-common xmlns="urn:ietf:params:xml:ns:yang:ietf-tcp-common">
  <keepalives>
    <idle-time>15</idle-time>
    <max-probes>3</max-probes>
    <probe-interval>30</probe-interval>
  </keepalives>
</tcp-common>
```

## [2.3.](#) YANG Module

The ietf-tcp-common YANG module references [[RFC6991](#)].

```
<CODE BEGINS> file "ietf-tcp-common@2022-03-07.yang"
```

### [3.](#) The "ietf-tcp-client" Module

This section defines a YANG 1.1 module called "ietf-tcp-client". A high-level overview of the module is provided in [Section 3.1](#). Examples illustrating the module's use are provided in Examples ([Section 3.2](#)). The YANG module itself is defined in [Section 3.3](#).

#### [3.1.](#) Data Model Overview

This section provides an overview of the "ietf-tcp-client" module in

terms of its features and groupings.

#### [3.1.1.1.](#) Features

The following diagram lists all the "feature" statements defined in the "ietf-tcp-client" module:

Features:

```
+-- local-binding-supported
+-- tcp-client-keepalives
+-- proxy-connect
+-- socks5-gss-api
+-- socks5-username-password
```

| The diagram above uses syntax that is similar to but not  
| defined in [[RFC8340](#)].

#### [3.1.1.2.](#) Groupings

The "ietf-tcp-client" module defines the following "grouping" statement:

```
* tcp-client-grouping
```

This grouping is presented in the following subsection.

##### [3.1.1.2.1.](#) The "tcp-client-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "tcp-client-grouping" grouping:

```
grouping tcp-client-grouping
  +-- remote-address          inet:host
  +-- remote-port?           inet:port-number
  +-- local-address?         inet:ip-address
  |   {local-binding-supported}?
  +-- local-port?            inet:port-number
  |   {local-binding-supported}?
  +-- proxy-server! {proxy-connect}?
  |   +-- (proxy-type)
  |       +--:(socks4)
  |           | +-- socks4-parameters
```

```

|      |      +-- remote-address      inet:ip-address
|      |      +-- remote-port?       inet:port-number
|      +---:(socks4a)
|      |      +-- socks4a-parameters
|      |      |      +-- remote-address      inet:host
|      |      |      +-- remote-port?       inet:port-number
|      +---:(socks5)
|      |      +-- socks5-parameters
|      |      |      +-- remote-address      inet:host
|      |      |      +-- remote-port?       inet:port-number
|      |      |      +-- authentication-parameters!
|      |      |      |      +-- (auth-type)
|      |      |      |      |      +---:(gss-api) {socks5-gss-api}?
|      |      |      |      |      |      +-- gss-api
|      |      |      |      |      +---:(username-password)
|      |      |      |      |      |      {socks5-username-password}?
|      |      |      |      |      |      +-- username-password
|      |      |      |      |      |      |      +-- username          string
|      |      |      |      |      |      |      +---u ct:password-grouping
+---u tcpcmn:tcp-common-grouping

```

Comments:

- \* The "remote-address" node, which is mandatory, may be configured as an IPv4 address, an IPv6 address, a hostname.
- \* The "remote-port" node is not mandatory, but its default value is the invalid value '0', thus forcing the consuming data model to refine it in order to provide it an appropriate default value.
- \* The "local-address" node, which is enabled by the "local-binding-supported" feature ([Section 2.1.2](#)), may be configured as an IPv4 address, an IPv6 address, or a wildcard value.
- \* The "local-port" node, which is enabled by the "local-binding-supported" feature ([Section 2.1.2](#)), is not mandatory. Its default value is '0', indicating that the operating system can pick an arbitrary port number.
- \* The "proxy-server" node is enabled by a "feature" statement and, for servers that enable it, is a "presence" container so that the

descendant "mandatory true" choice node does not imply that the proxy-server node must be configured.

- \* This grouping uses the "tcp-common-grouping" grouping discussed in [Section 2.1.3.1](#).

### [3.1.3](#). Protocol-accessible Nodes

The "ietf-tcp-client" module defines only "grouping" statements that are used by other modules to instantiate protocol-accessible nodes.

### [3.2](#). Example Usage

This section presents two examples showing the "tcp-client-grouping" populated with some data. This example shows a TCP-client configured to not connect via a proxy:

```
<!-- The outermost element below doesn't exist in the data model. -->
<!-- It simulates if the "grouping" were a "container" instead. -->
```

```
<tcp-client xmlns="urn:ietf:params:xml:ns:yang:ietf-tcp-client">
  <remote-address>www.example.com</remote-address>
  <remote-port>443</remote-port>
  <local-address>0.0.0.0</local-address>
  <local-port>0</local-port>
  <keepalives>
    <idle-time>15</idle-time>
    <max-probes>3</max-probes>
```

```

    <probe-interval>30</probe-interval>
  </keepalives>
</tcp-client>

```

This example shows a TCP-client configured to connect via a proxy:

```

<!-- The outermost element below doesn't exist in the data model. -->
<!-- It simulates if the "grouping" were a "container" instead. -->

<tcp-client xmlns="urn:ietf:params:xml:ns:yang:ietf-tcp-client">
  <remote-address>www.example.com</remote-address>
  <remote-port>443</remote-port>
  <local-address>0.0.0.0</local-address>
  <local-port>0</local-port>
  <proxy-server>
    <socks5-parameters>
      <remote-address>proxy.my-domain.com</remote-address>
      <remote-port>1080</remote-port>
      <authentication-parameters>
        <username-password>
          <username>foobar</username>
          <cleartext-password>secret</cleartext-password>
        </username-password>
      </authentication-parameters>
    </socks5-parameters>
  </proxy-server>
  <keepalives>
    <idle-time>15</idle-time>
    <max-probes>3</max-probes>
    <probe-interval>30</probe-interval>
  </keepalives>
</tcp-client>

```

### [3.3.](#) YANG Module

The ietf-tcp-client YANG module references [[RFC6991](#)].

```
<CODE BEGINS> file "ietf-tcp-client@2022-03-07.yang"
```

```

module ietf-tcp-client {
  yang-version 1.1;

```

```

namespace "urn:ietf:params:xml:ns:yang:ietf-tcp-client";
prefix tcpc;

import ietf-inet-types {

<CODE ENDS>

#### [4.](#) The "ietf-tcp-server" Module

This section defines a YANG 1.1 module called "ietf-tcp-server". A high-level overview of the module is provided in [Section 4.1](#). Examples illustrating the module's use are provided in Examples ([Section 4.2](#)). The YANG module itself is defined in [Section 4.3](#).

##### [4.1.](#) Data Model Overview

This section provides an overview of the "ietf-tcp-server" module in terms of its features and groupings.

##### [4.1.1.](#) Features

The following diagram lists all the "feature" statements defined in the "ietf-tcp-server" module:

Features:

+++ tcp-server-keepalives

| The diagram above uses syntax that is similar to but not  
| defined in [[RFC8340](#)].

#### [4.1.2.](#) Groupings

The "ietf-tcp-server" module defines the following "grouping" statement:

\* tcp-server-grouping

This grouping is presented in the following subsection.

##### [4.1.2.1.](#) The "tcp-server-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "tcp-server-grouping" grouping:

```
grouping tcp-server-grouping
  +-- local-address                inet:ip-address
  +-- local-port?                  inet:port-number
  +---u tcpcmn:tcp-common-grouping
```

Comments:

- \* The "local-address" node, which is mandatory, may be configured as an IPv4 address, an IPv6 address, or a wildcard value.
- \* The "local-port" node is not mandatory, but its default value is the invalid value '0', thus forcing the consuming data model to refine it in order to provide it an appropriate default value.
- \* This grouping uses the "tcp-common-grouping" grouping discussed in [Section 2.1.3.1](#).

#### [4.1.3.](#) Protocol-accessible Nodes

The "ietf-tcp-server" module defines only "grouping" statements that are used by other modules to instantiate protocol-accessible nodes.

## [4.2.](#) Example Usage

This section presents an example showing the "tcp-server-grouping" populated with some data.

```
<!-- The outermost element below doesn't exist in the data model. -->
<!-- It simulates if the "grouping" were a "container" instead. -->

<tcp-server xmlns="urn:ietf:params:xml:ns:yang:ietf-tcp-server">
  <local-address>10.20.30.40</local-address>
  <local-port>7777</local-port>
  <keepalives>
    <idle-time>15</idle-time>
    <max-probes>3</max-probes>
    <probe-interval>30</probe-interval>
  </keepalives>
</tcp-server>
```

## [4.3.](#) YANG Module

The ietf-tcp-server YANG module references [[RFC6991](#)].

```
<CODE BEGINS> file "ietf-tcp-server@2022-03-07.yang"

## [5.](#) Security Considerations

### [5.1.](#) The "ietf-tcp-common" YANG Module

The "ietf-tcp-common" YANG module defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC8341](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

None of the readable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-all" extension has not been set for any data nodes defined in this module.

None of the writable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-write" extension has not been set for any data nodes defined in this module.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

## [5.2.](#) The "ietf-tcp-client" YANG Module

The "ietf-tcp-client" YANG module defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC8341](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

One readable data node defined in this YANG module may be considered sensitive or vulnerable in some network environments. This node is as follows:

- \* The "proxy-server/socks5-parameters/authentication-parameters/username-password/password" node:

The cleartext "password" node defined in the "tcp-client-grouping" grouping is additionally sensitive to read operations such that, in normal use cases, it should never be returned to a client. For this reason, the NACM extension "default-deny-all" has been applied to it.

None of the writable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-write" extension has not been set for any data nodes defined in this module.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

Implementations are RECOMMENDED to implement the "local-binding-supported" feature for cryptographically-secure protocols, so as to enable more granular ingress/egress firewall rulebases. It is NOT RECOMMENDED to implement this feature for unsecure protocols, as per [\[RFC6056\]](#).

### [5.3.](#) The "ietf-tcp-server" YANG Module

The "ietf-tcp-server" YANG module defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [\[RFC6241\]](#) and RESTCONF [\[RFC8040\]](#). Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [\[RFC8341\]](#) provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

None of the readable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-all" extension has not been set for any data nodes defined in this module.

None of the writable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-write" extension has not been set for any data nodes defined in this module.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

## [6.](#) IANA Considerations

### [6.1.](#) The "IETF XML" Registry

This document registers two URIs in the "ns" subregistry of the IETF XML Registry [\[RFC3688\]](#). Following the format in [\[RFC3688\]](#), the

following registrations are requested:

URI: urn:ietf:params:xml:ns:yang:ietf-tcp-common

Registrant Contact: The IESG

XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-tcp-client

Registrant Contact: The IESG

XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-tcp-server

Registrant Contact: The IESG

XML: N/A, the requested URI is an XML namespace.

## [6.2.](#) The "YANG Module Names" Registry

This document registers two YANG modules in the YANG Module Names registry [[RFC6020](#)]. Following the format in [[RFC6020](#)], the following registrations are requested:

name: ietf-tcp-common  
namespace: urn:ietf:params:xml:ns:yang:ietf-tcp-common  
prefix: tcpcmn  
reference: RFC DDDD

name: ietf-tcp-client  
namespace: urn:ietf:params:xml:ns:yang:ietf-tcp-client  
prefix: tcpc  
reference: RFC DDDD

name: ietf-tcp-server  
namespace: urn:ietf:params:xml:ns:yang:ietf-tcp-server  
prefix: tcps  
reference: RFC DDDD

## [Appendix A](#). Change Log

This section is to be removed before publishing as an RFC.

### [A.1](#). 00 to 01

- \* Added 'local-binding-supported' feature to TCP-client model.

- \* Added 'keepalives-supported' feature to TCP-common model.
- \* Added 'external-endpoint-values' container and 'external-endpoints' feature to TCP-server model.

Groupings for TCP Clients and Servers

March 2022

[A.2.](#) 01 to 02

- \* Removed the 'external-endpoint-values' container and 'external-endpoints' feature from the TCP-server model.

[A.3.](#) 02 to 03

- \* Moved the common model section to be before the client and server specific sections.
- \* Added sections "Model Scope" and "Usage Guidelines for Configuring TCP Keep-Alives" to the common model section.

[A.4.](#) 03 to 04

- \* Fixed a few typos.

[A.5.](#) 04 to 05

- \* Removed commented out "grouping tcp-system-grouping" statement kept for reviewers.
- \* Added a "Note to Reviewers" note to first page.

[A.6.](#) 05 to 06

- \* Added support for TCP proxies.

[A.7.](#) 06 to 07

- \* Expanded "Data Model Overview section(s) [remove "wall" of tree diagrams].
- \* Updated the Security Considerations section.

[A.8.](#) 07 to 08

- \* Added missing IANA registration for "ietf-tcp-common"
- \* Added "mandatory true" for the "username" and "password" leafs
- \* Added an example of a TCP-client configured to connect via a proxy
- \* Fixed issues found by the SecDir review of the "keystore" draft.
- \* Updated the "ietf-tcp-client" module to use the new "password-grouping" grouping from the "crypto-types" module.

#### [A.9.](#) 08 to 09

- \* Addressed comments raised by YANG Doctor in the ct/ts/ks drafts.

#### [A.10.](#) 09 to 10

- \* Updated Abstract and Intro to address comments by Tom Petch.
- \* Removed the "tcp-connection-grouping" grouping (now models use the "tcp-common-grouping" directly).
- \* Added XML-comment above examples explaining the reason for the unusual top-most element's presence.
- \* Added Security Considerations section for the "local-binding-supported" feature.
- \* Replaced some hardcoded refs to <xref> elements.
- \* Fixed nits found by YANG Doctor reviews.
- \* Aligned modules with `pyang -f` formatting.
- \* Added an "Acknowledgements" section.

#### [A.11.](#) 10 to 11

- \* Replaced "base64encodedvalue==" with "BASE64VALUE=" in examples.

- \* Minor editorial nits

#### [A.12.](#) 11 to 12

- \* Fixed up the 'WG Web' and 'WG List' lines in YANG module(s)
- \* Fixed up copyright (i.e., s/Simplified/Revised/) in YANG module(s)

#### Acknowledgements

The authors would like to thank for following for lively discussions on list and in the halls (ordered by first name): Juergen Schoenwaelder, Ladislav Lhotka, Nick Hancock, and Tom Petch.
