 YANG Groupings for TCP Clients and TCP Servers

Abstract

This document defines three YANG 1.1 modules to support the configuration of TCP clients and TCP servers. The modules include basic parameters of a TCP connection relevant for client or server applications, as well as client configuration required for traversing proxies. The modules can be used either standalone or in conjunction with configuration of other stack protocol layers.

Editorial Note (To be removed by RFC Editor)

This draft contains placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

*AAAA --> the assigned RFC value for draft-ietf-netconf-crypto-types

*DDDD --> the assigned RFC value for this draft

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

*2024-02-08 --> the publication date of this draft

The "Relation to other RFCs" section [Section 1.1](#) contains the text "one or more YANG modules" and, later, "modules". This text is sourced from a file in a context where it is unknown how many modules a draft defines. The text is not wrong as is, but it may be improved by stating more directly how many modules are defined.

The "Relation to other RFCs" section [Section 1.1](#) contains a self-reference to this draft, along with a corresponding reference in the Appendix. Please replace the self-reference in this section with

"This RFC" (or similar) and remove the self-reference in the "Normative/Informative References" section, whichever it is in.

Tree-diagrams in this draft may use the '\\' line-folding mode defined in RFC 8792. However, nicer-to-the-eye is when the '\\\\' line-folding mode is used. The AD suggested suggested putting a request here for the RFC Editor to help convert "ugly" '\\' folded examples to use the '\\\\' folding mode. "Help convert" may be interpreted as, identify what looks ugly and ask the authors to make the adjustment.

The following Appendix section is to be removed prior to publication:

*[Appendix A](#). Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 11 August 2024.

1. Introduction

This document defines three YANG 1.1 [[RFC7950](#)] modules to support the configuration of TCP clients and TCP servers (TCP is defined in [[RFC9293](#)]), either as standalone or in conjunction with configuration of other stack protocol layers.

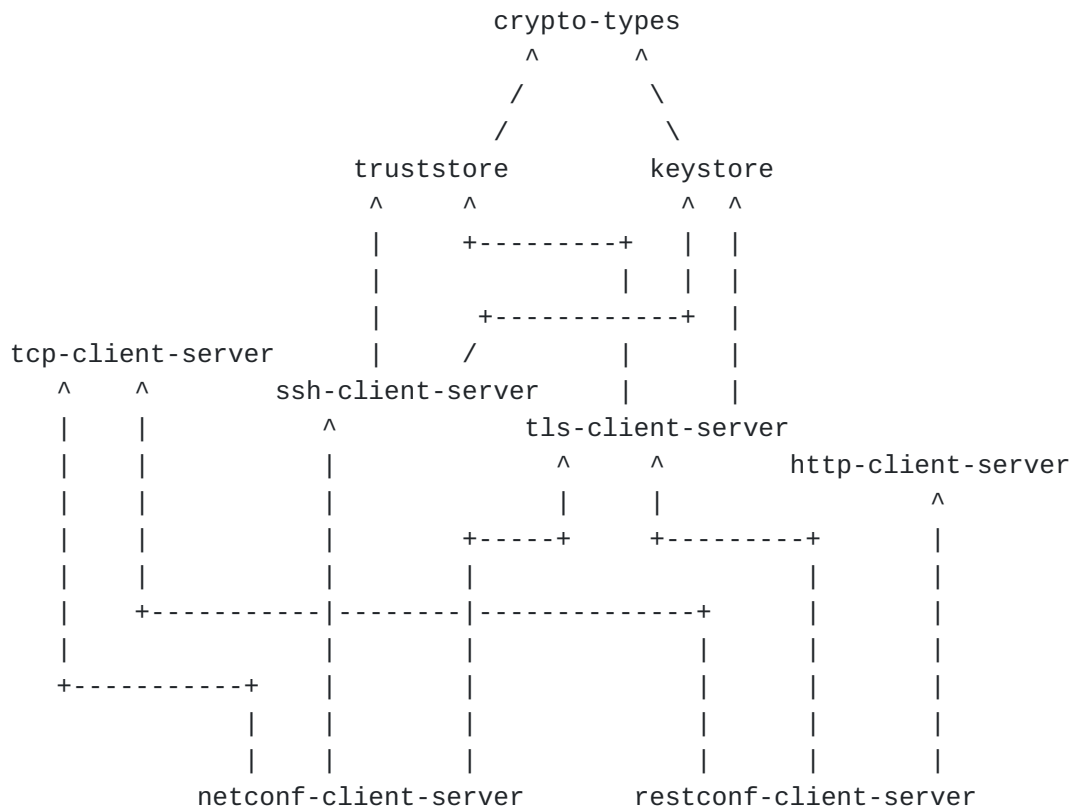

The modules focus on three different types of base TCP parameters that matter for TCP-based applications: First, the modules cover fundamental configuration of a TCP client or TCP server application, such as addresses and port numbers. Second, a reusable grouping enables modification of application-specific parameters for a TCP connections, such as use of TCP keep-alives. And third, client configuration for traversing proxies is included as well. In each case, the modules have a very narrow scope and focus on a minimum set of required parameters.

1.1. Relation to other RFCs

This document presents one or more YANG modules [[RFC7950](#)] that are part of a collection of RFCs that work together to, ultimately, enable the configuration of both the clients and servers of both the NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)] protocols.

The dependency relationship between the primary YANG groupings defined in the various RFCs is presented in the below diagram. In some cases, a draft may define secondary groupings that introduce dependencies not illustrated in the diagram. The labels in the diagram are a shorthand name for the defining RFC. The citation reference for shorthand name is provided below the diagram.

Please note that the arrows in the diagram point from referencer to referenced. For example, the "crypto-types" RFC does not have any dependencies, whilst the "keystore" RFC depends on the "crypto-types" RFC.

Label in Diagram	Originating RFC
crypto-types	[I-D.ietf-netconf-crypto-types]
truststore	[I-D.ietf-netconf-trust-anchors]
keystore	[I-D.ietf-netconf-keystore]
tcp-client-server	[I-D.ietf-netconf-tcp-client-server]
ssh-client-server	[I-D.ietf-netconf-ssh-client-server]
tls-client-server	[I-D.ietf-netconf-tls-client-server]
http-client-server	[I-D.ietf-netconf-http-client-server]
netconf-client-server	[I-D.ietf-netconf-netconf-client-server]
restconf-client-server	[I-D.ietf-netconf-restconf-client-server]

Table 1: Label in Diagram to RFC Mapping

1.2. Specification Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

1.3. Adherence to the NMDA

This document is compliant with the Network Management Datastore Architecture (NMDA) [[RFC8342](#)]. It does not define any protocol accessible nodes that are "config false".

2. The "ietf-tcp-common" Module

This section defines a YANG 1.1 module called "ietf-tcp-common". A high-level overview of the module is provided in [Section 2.1](#). Examples illustrating the module's use are provided in [Examples \(Section 2.2\)](#). The YANG module itself is defined in [Section 2.3](#).

2.1. Data Model Overview

This section provides an overview of the "ietf-tcp-common" module in terms of its features and groupings.

2.1.1. Model Scope

This document defines a common "grouping" statement for basic TCP connection parameters that matter to applications. It is "common" in that this grouping is used by both the "ietf-tcp-client" and "ietf-tcp-server" modules. In some TCP stacks, such parameters can also directly be set by an application using system calls, such as the sockets API. The base YANG model in this document focuses on modeling TCP keep-alives. This base model can be extended as needed.

2.1.2. Features

The following diagram lists all the "feature" statements defined in the "ietf-tcp-common" module:

Features:

```
+-- keepalives-supported
```

The diagram above uses syntax that is similar to but not defined in [[RFC8340](#)].

2.1.3. Groupings

The "ietf-tcp-common" module defines the following "grouping" statement:

```
*tcp-common-grouping
```

This grouping is presented in the following subsection.

2.1.3.1. The "tcp-common-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "tcp-common-grouping" grouping:

```
grouping tcp-common-grouping:
  +-- keepalives! {keepalives-supported}?
     +-- idle-time?          uint16
     +-- max-probes?        uint16
     +-- probe-interval?    uint16
```

Comments:

*The "keepalives" node is a "presence" container so that the mandatory descendant nodes do not imply that keepalives must be configured.

*The "idle-time", "max-probes", and "probe-interval" nodes have the common meanings. Please see the YANG module in [Section 2.3](#) for details.

2.1.4. Protocol-accessible Nodes

The "ietf-tcp-common" module defines only "grouping" statements that are used by other modules to instantiate protocol-accessible nodes. Thus this module, when implemented, does not itself define any protocol-accessible nodes.

2.1.5. Guidelines for Configuring TCP Keep-Alives

Network stacks may include "keep-alives" in their TCP implementations, although this practice is not universally accepted. If keep-alives are included, [[RFC9293](#)] mandates that the application MUST be able to turn them on or off for each TCP connection, and that they MUST default to off.

Keep-alive mechanisms exist in many protocols. Depending on the protocol stack, TCP keep-alives may only be one out of several alternatives. Which mechanism(s) to use depends on the use case and application requirements. If keep-alives are needed by an application, it is RECOMMENDED that the liveness check happens only at the protocol layers that are meaningful to the application.

A TCP keep-alive mechanism SHOULD only be invoked in server applications that might otherwise hang indefinitely and consume resources unnecessarily if a client crashes or aborts a connection during a network failure [[RFC9293](#)]. TCP keep-alives may consume significant resources both in the network and in endpoints (e.g., battery power). In addition, frequent keep-alives risk network

congestion. The higher the frequency of keep-alives, the higher the overhead.

Given the cost of keep-alives, parameters have to be configured carefully:

*The default idle interval (leaf "idle-time") MUST default to no less than two hours, i.e., 7200 seconds [[RFC9293](#)]. A lower value MAY be configured, but keep-alive messages SHOULD NOT be transmitted more frequently than once every 15 seconds. Longer intervals SHOULD be used when possible.

*The maximum number of sequential keep-alive probes that can fail (leaf "max-probes") trades off responsiveness and robustness against packet loss. ACK segments that contain no data are not reliably transmitted by TCP. Consequently, if a keep-alive mechanism is implemented it MUST NOT interpret failure to respond to any specific probe as a dead connection [[RFC9293](#)]. Typically, a single-digit number should suffice.

*TCP implementations may include a parameter for the number of seconds between TCP keep-alive probes (leaf "probe-interval"). In order to avoid congestion, the time interval between probes MUST NOT be smaller than one second. Significantly longer intervals SHOULD be used. It is important to note that keep-alive probes (or replies) can get dropped due to network congestion. Sending further probe messages into a congested path after a short interval, without backing off timers, could cause harm and result in a congestion collapse. Therefore it is essential to pick a large, conservative value for this interval.

2.2. Example Usage

This section presents an example showing the "tcp-common-grouping" populated with some data.

```
<!-- The outermost element below doesn't exist in the data model. -->
<!-- It simulates if the "grouping" were a "container" instead. -->

<tcp-common xmlns="urn:ietf:params:xml:ns:yang:ietf-tcp-common">
  <keepalives>
    <idle-time>7200</idle-time>
    <max-probes>9</max-probes>
    <probe-interval>75</probe-interval>
  </keepalives>
</tcp-common>
```

2.3. YANG Module

The ietf-tcp-common YANG module references [[RFC6991](#)] and [[RFC9293](#)].

```
<CODE BEGINS> file "ietf-tcp-common@2024-02-08.yang"

            "Sets the time interval between failed probes. The interval
            SHOULD be significantly longer than one second in order to
            avoid harm on a congested link.";
    }
} // container keepalives
} // grouping tcp-common-grouping
}

<CODE ENDS>

```

3. The "ietf-tcp-client" Module

This section defines a YANG 1.1 module called "ietf-tcp-client". A high-level overview of the module is provided in [Section 3.1](#). Examples illustrating the module's use are provided in [Examples \(Section 3.2\)](#). The YANG module itself is defined in [Section 3.3](#).

3.1. Data Model Overview

This section provides an overview of the "ietf-tcp-client" module in terms of its features and groupings.

3.1.1. Features

The following diagram lists all the "feature" statements defined in the "ietf-tcp-client" module:

Features:

```

+-- local-binding-supported
+-- tcp-client-keepalives
+-- proxy-connect
+-- socks5-gss-api
+-- socks5-username-password

```

The diagram above uses syntax that is similar to but not defined in [\[RFC8340\]](#).

3.1.2. Groupings

The "ietf-tcp-client" module defines the following "grouping" statement:

```
*tcp-client-grouping
```

This grouping is presented in the following subsection.

3.1.2.1. The "tcp-client-grouping" Grouping

The following tree diagram [\[RFC8340\]](#) illustrates the "tcp-client-grouping" grouping:

```
grouping tcp-client-grouping:
  +-- remote-address          inet:host
  +-- remote-port?           inet:port-number
  +-- local-address?         inet:ip-address
  |   {local-binding-supported}?
  +-- local-port?            inet:port-number
  |   {local-binding-supported}?
  +-- proxy-server! {proxy-connect}?
  |   +-- (proxy-type)
  |   |   +--:(socks4)
  |   |   |   +-- socks4-parameters
  |   |   |   |   +-- remote-address    inet:ip-address
  |   |   |   |   +-- remote-port?     inet:port-number
  |   |   |   +--:(socks4a)
  |   |   |   |   +-- socks4a-parameters
  |   |   |   |   |   +-- remote-address    inet:host
  |   |   |   |   |   +-- remote-port?     inet:port-number
  |   |   |   +--:(socks5)
  |   |   |   |   +-- socks5-parameters
  |   |   |   |   |   +-- remote-address    inet:host
  |   |   |   |   |   +-- remote-port?     inet:port-number
  |   |   |   |   |   +-- authentication-parameters!
  |   |   |   |   |   |   +-- (auth-type)
  |   |   |   |   |   |   |   +--:(gss-api) {socks5-gss-api}?
  |   |   |   |   |   |   |   |   +-- gss-api
  |   |   |   |   |   |   |   +--:(username-password)
  |   |   |   |   |   |   |   |   {socks5-username-password}?
  |   |   |   |   |   |   |   +-- username-password
  |   |   |   |   |   |   |   |   +-- username          string
  |   |   |   |   |   |   |   |   +---u ct:password-grouping
  +---u tcpcmn:tcp-common-grouping
```

Comments:

*The "remote-address" node, which is mandatory, may be configured as an IPv4 address, an IPv6 address, a hostname.

*The "remote-port" node is not mandatory, but its default value is the invalid value '0', thus forcing the consuming data model to refine it in order to provide it an appropriate default value.

*The "local-address" node, which is enabled by the "local-binding-supported" feature ([Section 2.1.2](#)), may be configured as an IPv4 address, an IPv6 address, or a wildcard value.

*The "local-port" node, which is enabled by the "local-binding-supported" feature ([Section 2.1.2](#)), is not mandatory. Its default value is '0', indicating that the operating system can pick an arbitrary port number.

*The "proxy-server" node is enabled by a "feature" statement and, for servers that enable it, is a "presence" container so that the descendant "mandatory true" choice node does not imply that the proxy-server node must be configured.

*This grouping uses the "tcp-common-grouping" grouping discussed in [Section 2.1.3.1](#).

3.1.3. Protocol-accessible Nodes

The "ietf-tcp-client" module defines only "grouping" statements that are used by other modules to instantiate protocol-accessible nodes. Thus this module, when implemented, does not itself define any protocol-accessible nodes.

3.2. Example Usage

This section presents two examples showing the "tcp-client-grouping" populated with some data. This example shows a TCP-client configured to not connect via a proxy:

```

<!-- The outermost element below doesn't exist in the data model. -->
<!-- It simulates if the "grouping" were a "container" instead. -->

<tcp-client xmlns="urn:ietf:params:xml:ns:yang:ietf-tcp-client">
  <remote-address>www.example.com</remote-address>
  <remote-port>8443</remote-port>
  <local-address>192.0.2.2</local-address>
  <local-port>12345</local-port>
  <keepalives>
    <idle-time>7200</idle-time>
    <max-probes>9</max-probes>
    <probe-interval>75</probe-interval>
  </keepalives>
</tcp-client>

```

This example shows a TCP-client configured to connect via a proxy:

```

<!-- The outermost element below doesn't exist in the data model. -->
<!-- It simulates if the "grouping" were a "container" instead. -->

<tcp-client xmlns="urn:ietf:params:xml:ns:yang:ietf-tcp-client">
  <remote-address>www.example.com</remote-address>
  <remote-port>8443</remote-port>
  <local-address>192.0.2.2</local-address>
  <local-port>12345</local-port>
  <proxy-server>
    <socks5-parameters>
      <remote-address>proxy.example.com</remote-address>
      <remote-port>1080</remote-port>
      <authentication-parameters>
        <username-password>
          <username>foobar</username>
          <cleartext-password>secret</cleartext-password>
        </username-password>
      </authentication-parameters>
    </socks5-parameters>
  </proxy-server>
  <keepalives>
    <idle-time>7200</idle-time>
    <max-probes>9</max-probes>
    <probe-interval>75</probe-interval>
  </keepalives>
</tcp-client>

```

3.3. YANG Module

The ietf-tcp-client YANG module references [\[SOCKS 4A\]](#), [\[RFC1928\]](#), [\[RFC1929\]](#), [\[RFC2743\]](#), [\[RFC6991\]](#), [\[RFC9293\]](#), and [\[I-D.ietf-netconf-crypto-types\]](#).

```
<CODE BEGINS> file "ietf-tcp-client@2024-02-08.yang"
```

```
module ietf-tcp-client {
  yang-version 1.1;
  namespace "urn:ietf:params:xml:ns:yang:ietf-tcp-client";
  prefix tcpc;

  import ietf-inet-types {
    prefix inet;
    reference
      "RFC 6991: Common YANG Data Types";
  }

  import ietf-crypto-types {

<CODE ENDS>

4. The "ietf-tcp-server" Module

This section defines a YANG 1.1 module called "ietf-tcp-server". A high-level overview of the module is provided in [Section 4.1](#). Examples illustrating the module's use are provided in [Examples \(Section 4.2\)](#). The YANG module itself is defined in [Section 4.3](#).

4.1. Data Model Overview

This section provides an overview of the "ietf-tcp-server" module in terms of its features and groupings.

4.1.1. Features

The following diagram lists all the "feature" statements defined in the "ietf-tcp-server" module:

Features:

```
+-- tcp-server-keepalives
```

The diagram above uses syntax that is similar to but not defined in [\[RFC8340\]](#).

4.1.2. Groupings

The "ietf-tcp-server" module defines the following "grouping" statement:

```
*tcp-server-grouping
```

This grouping is presented in the following subsection.

4.1.2.1. The "tcp-server-grouping" Grouping

The following tree diagram [\[RFC8340\]](#) illustrates the "tcp-server-grouping" grouping:

```
grouping tcp-server-grouping:
+-- local-address          inet:ip-address
+-- local-port?           inet:port-number
+---u tcpcmn:tcp-common-grouping
```

Comments:

*The "local-address" node, which is mandatory, may be configured as an IPv4 address, an IPv6 address, or a wildcard value.

*The "local-port" node is not mandatory, but its default value is the invalid value '0', thus forcing the consuming data model to refine it in order to provide it an appropriate default value.

*This grouping uses the "tcp-common-grouping" grouping discussed in [Section 2.1.3.1](#).

4.1.3. Protocol-accessible Nodes

The "ietf-tcp-server" module defines only "grouping" statements that are used by other modules to instantiate protocol-accessible nodes. Thus this module, when implemented, does not itself define any protocol-accessible nodes.

4.2. Example Usage

This section presents an example showing the "tcp-server-grouping" populated with some data.

```
<!-- The outermost element below doesn't exist in the data model. -->
<!-- It simulates if the "grouping" were a "container" instead. -->

<tcp-server xmlns="urn:ietf:params:xml:ns:yang:ietf-tcp-server">
  <local-address>192.0.2.2</local-address>
  <local-port>49152</local-port>
  <keepalives>
    <idle-time>7200</idle-time>
    <max-probes>9</max-probes>
    <probe-interval>75</probe-interval>
  </keepalives>
</tcp-server>
```

4.3. YANG Module

The ietf-tcp-server YANG module references [[RFC6991](#)] and [[RFC9293](#)].

```
<CODE BEGINS> file "ietf-tcp-server@2024-02-08.yang"
```

```

<CODE ENDS>

5. Security Considerations

5.1. Considerations for the "ietf-tcp-common" YANG Module

This section follows the template defined in [Section 3.7.1](#) of [\[RFC8407\]](#).

The "ietf-tcp-common" YANG module defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [\[RFC6241\]](#) and RESTCONF [\[RFC8040\]](#). Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The Network Access Control Model (NACM) [\[RFC8341\]](#) provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

Please be aware that this YANG module uses groupings from other YANG modules that define nodes that may be considered sensitive or vulnerable in network environments. Please review the Security Considerations for dependent YANG modules for information as to which nodes may be considered sensitive or vulnerable in network environments.

None of the readable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM

"default-deny-all" extension has not been set for any data nodes defined in this module.

None of the writable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-write" extension has not been set for any data nodes defined in this module.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

5.2. Considerations for the "ietf-tcp-client" YANG Module

This section follows the template defined in [Section 3.7.1](#) of [\[RFC8407\]](#).

The "ietf-tcp-client" YANG module defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [\[RFC6241\]](#) and RESTCONF [\[RFC8040\]](#). Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The Network Access Control Model (NACM) [\[RFC8341\]](#) provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

Please be aware that this YANG module uses groupings from other YANG modules that define nodes that may be considered sensitive or vulnerable in network environments. Please review the Security Considerations for dependent YANG modules for information as to which nodes may be considered sensitive or vulnerable in network environments.

One readable data node defined in this YANG module may be considered sensitive or vulnerable in some network environments. This node is as follows:

*The "proxy-server/socks5-parameters/authentication-parameters/username-password/password" node:

The cleartext "password" node defined in the "tcp-client-grouping" grouping is additionally sensitive to read operations such that, in normal use cases, it should never be returned to a client. For this reason, the NACM extension "default-deny-all" has been applied to it.

None of the writable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-write" extension has not been set for any data nodes defined in this module.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

Implementations are RECOMMENDED to implement the "local-binding-supported" feature for cryptographically-secure protocols, so as to enable more granular ingress/egress firewall rulebases. It is NOT RECOMMENDED to implement this feature for unsecure protocols, as per [\[RFC6056\]](#).

5.3. Considerations for the "ietf-tcp-server" YANG Module

This section follows the template defined in [Section 3.7.1](#) of [\[RFC8407\]](#).

The "ietf-tcp-server" YANG module defines "grouping" statements that are designed to be accessed via YANG based management protocols, such as NETCONF [\[RFC6241\]](#) and RESTCONF [\[RFC8040\]](#). Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The Network Access Control Model (NACM) [\[RFC8341\]](#) provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the module in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

Please be aware that this YANG module uses groupings from other YANG modules that define nodes that may be considered sensitive or vulnerable in network environments. Please review the Security Considerations for dependent YANG modules for information as to which nodes may be considered sensitive or vulnerable in network environments.

None of the readable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-all" extension has not been set for any data nodes defined in this module.

None of the writable data nodes defined in this YANG module are considered sensitive or vulnerable in network environments. The NACM "default-deny-write" extension has not been set for any data nodes defined in this module.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

6. IANA Considerations

6.1. The "IETF XML" Registry

This document registers three URIs in the "ns" subregistry of the IETF XML Registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registrations are requested:

URI: urn:ietf:params:xml:ns:yang:ietf-tcp-common
Registrant Contact: The IESG
XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-tcp-client
Registrant Contact: The IESG
XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-tcp-server
Registrant Contact: The IESG
XML: N/A, the requested URI is an XML namespace.

6.2. The "YANG Module Names" Registry

This document registers three YANG modules in the YANG Module Names registry [[RFC6020](#)]. Following the format in [[RFC6020](#)], the following registrations are requested:

name: ietf-tcp-common
namespace: urn:ietf:params:xml:ns:yang:ietf-tcp-common
prefix: tcpcmn
reference: RFC DDDD

name: ietf-tcp-client
namespace: urn:ietf:params:xml:ns:yang:ietf-tcp-client
prefix: tcpc
reference: RFC DDDD

name: ietf-tcp-server
namespace: urn:ietf:params:xml:ns:yang:ietf-tcp-server
prefix: tcps
reference: RFC DDDD

Appendix A. Change Log

This section is to be removed before publishing as an RFC.

A.1. 00 to 01

*Added 'local-binding-supported' feature to TCP-client model.

*Added 'keepalives-supported' feature to TCP-common model.

*Added 'external-endpoint-values' container and 'external-endpoints' feature to TCP-server model.

A.2. 01 to 02

*Removed the 'external-endpoint-values' container and 'external-endpoints' feature from the TCP-server model.

A.3. 02 to 03

*Moved the common model section to be before the client and server specific sections.

*Added sections "Model Scope" and "Usage Guidelines for Configuring TCP Keep-Alives" to the common model section.

A.4. 03 to 04

*Fixed a few typos.

A.5. 04 to 05

*Removed commented out "grouping tcp-system-grouping" statement kept for reviewers.

*Added a "Note to Reviewers" note to first page.

A.6. 05 to 06

*Added support for TCP proxies.

A.7. 06 to 07

*Expanded "Data Model Overview section(s) [remove "wall" of tree diagrams].

*Updated the Security Considerations section.

A.8. 07 to 08

*Added missing IANA registration for "ietf-tcp-common"

*Added "mandatory true" for the "username" and "password" leafs

*Added an example of a TCP-client configured to connect via a proxy

*Fixed issues found by the SecDir review of the "keystore" draft.

*Updated the "ietf-tcp-client" module to use the new "password-grouping" grouping from the "crypto-types" module.

A.9. 08 to 09

*Addressed comments raised by YANG Doctor in the ct/ts/ks drafts.

A.10. 09 to 10

*Updated Abstract and Intro to address comments by Tom Petch.

*Removed the "tcp-connection-grouping" grouping (now models use the "tcp-common-grouping" directly).

*Added XML-comment above examples explaining the reason for the unusual top-most element's presence.

*Added Security Considerations section for the "local-binding-supported" feature.

*Replaced some hardcoded refs to <xref> elements.

*Fixed nits found by YANG Doctor reviews.

*Aligned modules with `pyang -f` formatting.

*Added an "Acknowledgements" section.

A.11. 10 to 11

*Replaced "base64encodedvalue==" with "BASE64VALUE=" in examples.

*Minor editorial nits

A.12. 11 to 12

*Fixed up the 'WG Web' and 'WG List' lines in YANG module(s)

*Fixed up copyright (i.e., s/Simplified/Revised/) in YANG module(s)

A.13. 12 to 13

*NO UPDATE.

A.14. 13 to 14

*Updated per Shepherd reviews impacting the suite of drafts.

A.15. 14 to 15

*Updated per Shepherd reviews impacting the suite of drafts.

A.16. 15 to 16

*Updated per Tom Petch review.

*Added refs to RFC9293 and SOCKS 4A.

*Fixed examples to use IETF-sanctioned values for examples.

A.17. 16 to 17

*Addresses AD review comments.

*Added note to Editor to fix line foldings.

*Added Security Considerations text to also look a SC-section from imported modules.

*Fixed bug: s/augment "keepalives"/refine "keepalives"/

*Set defaults for idle-time, max-probes, and probe-interval (removed "mandatory true").

*Updated examples to use IETF recommended values for examples.

A.18. 18 to 19

*Addresses AD review by Rob Wilton.

A.19. 18 to 19

*Replace RFC 1122 with RFC 9293.

A.20. 19 to 20

*Addresses 1st-round of IESG reviews.

A.21. 20 to 21

*Addresses issues found in OpsDir review of the ssh-client-server draft.

Acknowledgements

The authors would like to thank for following for lively discussions on list and in the halls (ordered by first name): Jürgen Schönwälder, Ladislav Lhotka, Nick Hancock, Per Andersson, Rob Wilton, and Tom Petch.
