Internet-Draft

Intended status: Standards Track

Expires: September 10, 2019

K. Watsen Watsen Networks March 9, 2019

YANG Data Model for Global Trust Anchors draft-ietf-netconf-trust-anchors-03

Abstract

This document defines a YANG 1.1 data model for configuring global sets of X.509 certificates and SSH host-keys that can be referenced by other data models for trust. While the SSH host-keys are uniquely for the SSH protocol, the X.509 certificates may have multiple uses, including authenticating protocol peers and verifying signatures.

Editorial Note (To be removed by RFC Editor)

This draft contains many placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

- o "XXXX" --> the assigned RFC value for this draft
- o "YYYY" --> the assigned RFC value for <u>draft-ietf-netconf-crypto-types</u>

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

o "2019-03-09" --> the publication date of this draft

The following Appendix section is to be removed prior to publication:

o Appendix A. Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of $\underline{\mathsf{BCP}}$ 78 and $\underline{\mathsf{BCP}}$ 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute

working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 10, 2019.

1. Introduction

This document defines a YANG 1.1 [RFC7950] data model for configuring global sets of X.509 certificates and SSH host-keys that can be referenced by other data models for trust. While the SSH host-keys are uniquely for the SSH protocol, the X.509 certificates may be used for multiple uses, including authenticating protocol peers and verifying signatures.

This document in compliant with Network Management Datastore Architecture (NMDA) [RFC8342]. For instance, to support trust anchors installed during manufacturing, it is expected that such data may appear only in <operational>.

1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP
14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

1.2. Tree Diagram Notation

Tree diagrams used in this document follow the notation defined in [RFC8340].

2. The Trust Anchors Model

2.1. Tree Diagram

The following tree diagram provides an overview of the "ietf-trust-anchors" module.

```
module: ietf-trust-anchors
  +--rw trust-anchors
    +--rw pinned-certificates* [name] {x509-certificates}?
     | +--rw name
                                   string
      +--rw description?
                                   string
    | +--rw pinned-certificate* [name]
          +--rw name
                                          string
                                          trust-anchor-cert-cms
          +--rw cert
          +---n certificate-expiration
             +-- expiration-date
                                   yang:date-and-time
    +--rw pinned-host-keys* [name] {ssh-host-keys}?
       +--rw name
                                string
       +--rw description?
                                string
       +--rw pinned-host-key* [name]
          +--rw name
                        string
          +--rw host-key ct:ssh-host-key
```

2.2. Example Usage

The following example illustrates trust anchors in <operational> as described by Section 5.3 in RFC8342. This datastore view illustrates data set by the manufacturing process alongside conventional configuration. This trust anchors instance has six sets of pinned certificates and one set of pinned host keys.

```
<trust-anchors
  xmlns="urn:ietf:params:xml:ns:yang:ietf-trust-anchors"
  xmlns:or="urn:ietf:params:xml:ns:yang:ietf-origin">
  <!-- Manufacturer's trusted root CA certs -->
  <pinned-certificates or:origin="or:system">
   <name>manufacturers-root-ca-certs</name>
   <description>
     Certificates built into the device for authenticating
     manufacturer-signed objects, such as TLS server certificates,
     vouchers, etc. Note, though listed here, these are not
     configurable; any attempt to do so will be denied.
   </description>
   <pinned-certificate>
     <name>Manufacturer Root CA cert 1</name>
     <cert>base64encodedvalue==</cert>
   <pinned-certificate>
     <name>Manufacturer Root CA cert 2
     <cert>base64encodedvalue==</cert>
   </pinned-certificate>
  </pinned-certificates>
```

```
<!-- specific end-entity certs for authenticating servers -->
<pinned-certificates or:origin="or:intended">
 <name>explicitly-trusted-server-certs
 <description>
   Specific server authentication certificates for explicitly
   trusted servers. These are needed for server certificates
   that are not signed by a pinned CA.
 </description>
 <pinned-certificate>
   <name>Fred Flintstone</name>
   <cert>base64encodedvalue==</cert>
 <!-- trusted CA certs for authenticating servers -->
<pinned-certificates or:origin="or:intended">
 <name>explicitly-trusted-server-ca-certs
 <description>
   Trust anchors (i.e. CA certs) that are used to authenticate
   server connections. Servers are authenticated if their
   certificate has a chain of trust to one of these CA
   certificates.
 </description>
 <pinned-certificate>
   <name>ca.example.com</name>
   <cert>base64encodedvalue==</cert>
 <!-- specific end-entity certs for authenticating clients -->
<pinned-certificates or:origin="or:intended">
 <name>explicitly-trusted-client-certs</name>
 <description>
   Specific client authentication certificates for explicitly
   trusted clients. These are needed for client certificates
   that are not signed by a pinned CA.
 </description>
 <pinned-certificate>
   <name>George Jetson</name>
   <cert>base64encodedvalue==</cert>
 <!-- trusted CA certs for authenticating clients -->
<pinned-certificates or:origin="or:intended">
 <name>explicitly-trusted-client-ca-certs
 <description>
   Trust anchors (i.e. CA certs) that are used to authenticate
```

```
client connections. Clients are authenticated if their
     certificate has a chain of trust to one of these CA
     certificates.
   </description>
   <pinned-certificate>
     <name>ca.example.com</name>
     <cert>base64encodedvalue==</cert>
   <!-- trusted CA certs for random HTTPS servers on Internet -->
 <pinned-certificates or:origin="or:system">
   <name>common-ca-certs</name>
   <description>
     Trusted certificates to authenticate common HTTPS servers.
     These certificates are similar to those that might be
     shipped with a web browser.
   </description>
   <pinned-certificate>
     <name>ex-certificate-authority</name>
     <cert>base64encodedvalue==</cert>
   <!-- specific SSH host keys for authenticating clients -->
 <pinned-host-keys or:origin="or:intended">
   <name>explicitly-trusted-ssh-host-keys</name>
   <description>
     Trusted SSH host keys used to authenticate SSH servers.
     These host keys would be analogous to those stored in
     a known_hosts file in OpenSSH.
   </description>
   <pinned-host-key>
     <name>corp-fw1</name>
     <host-key>base64encodedvalue==</host-key>
   </pinned-host-key>
 </pinned-host-keys>
</trust-anchors>
```

The following example illustrates the "certificate-expiration" notification in use with the NETCONF protocol.

```
======= NOTE: '\\' line wrapping per BCP XX (RFC XXXX) ========
<notification
 xmlns="urn:ietf:params:xml:ns:netconf:notification:1.0">
 <eventTime>2018-05-25T00:01:00Z</eventTime>
 <trust-anchors</pre>
   xmlns="urn:ietf:params:xml:ns:yang:ietf-trust-anchors">
   <pinned-certificates>
     <name>explicitly-trusted-client-certs
     <pinned-certificate>
       <name>George Jetson</name>
       <certificate-expiration>
         <expiration-date>2018-08-05T14:18:53-05:00</expiration-dat\</pre>
\e>
       </certificate-expiration>
     </trust-anchors>
</notification>
```

2.3. YANG Module

```
This YANG module imports modules from [RFC8341] and
[I-D.ietf-netconf-crypto-types].

3. Security Considerations

The YANG module defined in this document is designed to be accessed via YANG based management protocols, such as NETCONF [RFC6241] and RESTCONF [RFC8040]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [RFC8341] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

/: The entire data tree defined by this module is sensitive to write operations. For instance, the addition or removal of any trust anchor may dramatically alter the implemented security policy. For this reason, the NACM extension "default-denywrite" has been set for the entire data tree.

None of the readable data nodes in this YANG module are considered sensitive or vulnerable in network environments.

This module does not define any RPCs, actions, or notifications, and thus the security consideration for such is not provided here.

4. IANA Considerations

4.1. The IETF XML Registry

This document registers one URI in the "ns" subregistry of the IETF XML Registry [RFC3688]. Following the format in [RFC3688], the following registration is requested:

URI: urn:ietf:params:xml:ns:yang:ietf-trust-anchors Registrant Contact: The NETCONF WG of the IETF. XML: N/A, the requested URI is an XML namespace.

4.2. The YANG Module Names Registry

This document registers one YANG module in the YANG Module Names registry [RFC6020]. Following the format in [RFC6020], the the following registration is requested:

name: ietf-trust-anchors

namespace: urn:ietf:params:xml:ns:yang:ietf-trust-anchors

prefix: ta
reference: RFC XXXX

Appendix A. Change Log

A.1. 00 to 01

- o Added features "x509-certificates" and "ssh-host-keys".
- o Added nacm:default-deny-write to "trust-anchors" container.

A.2. 01 to 02

o Switched "list pinned-certificate" to use the "trust-anchor-cert-grouping" from crypto-types. Effectively the same definition as before.

A.3. 02 to 03

o Updated copyright date, boilerplate template, affiliation, folding algorithm, and reformatted the YANG module.
