A YANG Data Model for Syslog Configuration
draft-ietf-netmod-syslog-model-16

Abstract

This document defines a YANG data model for the configuration of a syslog process. It is intended this model be used by vendors who implement syslog in their systems.

Editorial Note (To be removed by RFC Editor)

This draft contains many placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

- o "xxxx" --> the assigned RFC value for [draft-ietf-netconf-keystore](#)
- o "yyyy" --> the assigned RFC value for [draft-ietf-netconf-tls-client-server](#)
- o "zzzz" --> the assigned RFC value for this draft

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on February 10, 2018.

[1. Introduction](#)

Operating systems, processes and applications generate messages indicating their own status or the occurrence of events. These messages are useful for managing and/or debugging the network and its services. The BSD syslog protocol is a widely adopted protocol that is used for transmission and processing of the message.

Since each process, application and operating system was written somewhat independently, there is little uniformity to the content of syslog messages. For this reason, no assumption is made upon the formatting or contents of the messages. The protocol is simply

designed to transport these event messages. No acknowledgement of

the receipt is made.

Essentially, a syslog process receives messages (from the kernel, processes, applications or other syslog processes) and processes them. The processing may involve logging to a local file, and/or displaying on console, and/or relaying to syslog processes on other machines. The processing is determined by the "facility" that originated the message and the "severity" assigned to the message by the facility.

We are using definitions of syslog protocol from [RFC5424](#) [[RFC5424](#)] in this RFC.

[1.1.](#) Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119](#) [[RFC2119](#)] and [RFC8174](#) [[RFC8174](#)].

[1.2.](#) Terminology

The term "originator" is defined in [[RFC5424](#)]: an "originator" generates syslog content to be carried in a message.

The term "relay" is defined in [[RFC5424](#)]: a "relay" forwards messages, accepting messages from originators or other relays and sending them to collectors or other relays

The term "collectors" is defined in [[RFC5424](#)]: a "collector" gathers syslog content for further analysis.

The term "action" refers to the processing that takes place for each syslog message received.

[1.3.](#) Tree Diagrams

A simplified graphical representation of the data models is used in this document. The meaning of the symbols in these diagrams is as follows:

- o Brackets "[" and "]" enclose list keys.
- o Braces "{" and "}" enclose feature names, and indicate that the named feature must be present for the subtree to be present.
- o Abbreviations before data node names: "rw" means configuration (read-write) and "ro" state data (read-only).
- o Symbols after data node names: "?" means an optional node, "!"

means a presence container, and "*" denotes a list and leaf-list.

- o Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").

- o Ellipsis ("...") stands for contents of subtrees that are not shown.

2. Problem Statement

This document defines a YANG [[RFC7950](#)] configuration data model that may be used to configure the syslog feature running on a system. YANG models can be used with network management protocols such as NETCONF [[RFC6241](#)] to install, manipulate, and delete the configuration of network devices.

The data model makes use of the YANG "feature" construct which allows implementations to support only those syslog features that lie within their capabilities.

This module can be used to configure the syslog application conceptual layers as implemented on the target system.

3. Design of the Syslog Model

The syslog model was designed by comparing various syslog features implemented by various vendors' in different implementations.

This draft addresses the common leafs between implementations and creates a common model, which can be augmented with proprietary features, if necessary. This model is designed to be very simple for maximum flexibility.

Some optional features are defined in this document to specify functionality that is present in specific vendor configurations.

Syslog consists of originators and collectors. The following diagram shows syslog messages flowing from an originator, to collectors where filtering can take place.

Originators

Collectors

Figure 1. Syslog Processing Flow

Collectors are configured using the leaves in the syslog model "actions" container which correspond to each message collector:

```

console
log file(s)
remote relay(s)/collector(s)

```

Within each action, a selector is used to filter syslog messages. A selector consists of a list of one or more facility-severity matches, and, if supported via the select-match feature, an optional regular expression pattern match that is performed on the SYSLOG-MSG [\[RFC5424\]](#) field.

A syslog message is processed if:

- There is an element of facility-list (F, S) where
 - the message facility matches F (if it is present)
 - and the message severity matches S (if it is present)
- or the message text matches the regex pattern (if it is present)

The facility is one of a specific syslog-facility, or all facilities.

The severity is one of type syslog-severity, all severities, or none. None is a special case that can be used to disable a filter. When filtering severity, the default comparison is that messages of the specified severity and higher are selected to be logged. This is shown in the model as "default equals-or-higher". This behavior can be altered if the select-adv-compare feature is enabled to specify a compare operation and an action. Compare operations are: "equals" to select messages with this single severity, or "equals-or-higher" to select messages of the specified severity and higher. Actions are used to log the message or block the message from being logged.

Many vendors extend the list of facilities available for logging in their implementation. An example is included in Extending Facilities (Appendix A.1).

3.1. Syslog Module

A simplified graphical representation of the data model is used in this document. Please see [Section 1.3](#) for tree diagram notation.

```

5. Usage Examples

Requirement:

Enable console logging of syslogs of severity critical

Here is the example syslog configuration xml:

```
<config xmlns:xc="urn:ietf:params:xml:ns:netconf:base:1.0">
  <syslog xmlns="urn:ietf:params:xml:ns:yang:ietf-syslog"
    xmlns:syslog="urn:ietf:params:xml:ns:yang:ietf-syslog">
    <actions>
      <console>
        <facility-filter>
          <facility-list>
            <facility>all</facility>
            <severity>critical</severity>
          </facility-list>
        </facility-filter>
      </console>
    </actions>
  </syslog>
</config>
```

Enable remote logging of syslogs to udp destination 2001:db8:a0b:12f0::1
for facility auth, severity error

```
<config xmlns:xc="urn:ietf:params:xml:ns:netconf:base:1.0">
  <syslog xmlns="urn:ietf:params:xml:ns:yang:ietf-syslog"
    xmlns:syslog="urn:ietf:params:xml:ns:yang:ietf-syslog">
    <actions>
      <remote>
        <destination>
          <name>remote1</name>
          <udp>
            <address>2001:db8:a0b:12f0::1</address>
          </udp>
          <facility-filter>
            <facility-list>
              <facility>auth</facility>
              <severity>error</severity>
            </facility-list>
          </facility-filter>
        </destination>
      </remote>
    </actions>
  </syslog>
</config>
```

7. IANA Considerations

This document registers one URI in the IETF XML registry [[RFC3688](#)].

Following the format in [RFC 3688](#), the following registration is requested to be made:

URI: urn:ietf:params:xml:ns:yang:ietf-syslog

Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

This document registers a YANG module in the YANG Module Names registry [[RFC7950](#)].

name: ietf-syslog namespace: urn:ietf:params:xml:ns:yang:ietf-syslog

prefix: ietf-syslog

reference: RFC zzzz

8. Security Considerations

The YANG module defined in this document is designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual

authentication.

The NETCONF access control model (NACM) [[RFC6536](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations.

8.1. Resource Constraints

It is the responsibility of the network administrator to ensure that the configured message flow does not overwhelm system resources.

Network administrators must take the time to estimate the appropriate storage capacity caused by the configuration of actions/file using file-archive attributes to limit storage used.

8.2. Inappropriate Configuration

It is the responsibility of the network administrator to ensure that the messages are actually going to the intended recipients.

[Appendix A. Implementor Guidelines](#)

[Appendix A.1. Extending Facilities](#)

Many vendors extend the list of facilities available for logging in their implementation. Additional facilities may not work with the syslog protocol as defined in [[RFC5424](#)] and hence such facilities apply for local syslog-like logging functionality.

The following is an example that shows how additional facilities could be added to the list of available facilities (in this example two facilities are added):

```
module vendor-syslog-types-example {
  namespace "urn:vendor:params:xml:ns:yang:vendor-syslog-types";
  prefix vendor-syslogtypes;

  import ietf-syslog {
    prefix syslogtypes;
  }

  organization "Example, Inc.";
  contact
    "Example, Inc.
     Customer Service

     E-mail: syslog-yang@example.com";

  description
    "This module contains a collection of vendor-specific YANG type
     definitions for SYSLOG.";

  revision 2017-08-11 {
    description
      "Version 1.0";
    reference
      "Vendor SYSLOG Types: SYSLOG YANG Model";
  }

  identity vendor_specific_type_1 {
    base syslogtypes:syslog-facility;
  }
