A YANG Data Model for System Management
draft-ietf-netmod-system-mgmt-16

Abstract

This document defines a YANG data model for the configuration and identification of some common system properties within a device containing a NETCONF server. This includes data node definitions for system identification, time-of-day management, user management, DNS resolver configuration, and some protocol operations for system management.

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on November 15, 2014.

[1](#). Introduction

This document defines a YANG [[RFC6020](#)] data model for the configuration and identification of some common properties within a device containing a NETCONF server.

Devices that are managed by NETCONF and perhaps other mechanisms have common properties that need to be configured and monitored in a standard way.

The "ietf-system" YANG module defined in this document provides the following features:

- o system identification configuration and monitoring
- o system time-of-day configuration and monitoring
- o user authentication configuration
- o local users configuration
- o DNS resolver configuration
- o system control operations (shutdown, restart, setting time)

[1.1](#). Terminology

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#), [[RFC2119](#)].

The following terms are defined in [[RFC6241](#)] and are not redefined here:

- o client

- o configuration data
- o server
- o state data

[1.2.](#) Tree Diagrams

A simplified graphical representation of the data model is used in this document. The meaning of the symbols in these diagrams is as follows:

- o Brackets "[" and "]" enclose list keys.
- o Abbreviations before data node names: "rw" means configuration (read-write) and "ro" state data (read-only).
- o Symbols after data node names: "?" means an optional node, "!" means a presence container, and "*" denotes a list and leaf-list.
- o Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").
- o Ellipsis ("...") stands for contents of subtrees that are not shown.

[2.](#) Objectives

[2.1.](#) System Identification

There are many common properties used to identify devices, operating systems, software versions, etc. that need to be supported in the system data module. These objects are defined as operational state data and the information returned by the server is intended to be specific to the device vendor.

Some user-configurable administrative strings are also provided, such as the system location and description.

[2.2.](#) System Time Management

The management of the date and time used by the system need to be supported. Use of one or more NTP servers to automatically set the system date and time need to be possible. Utilization of the Timezone database [[RFC6557](#)] also need to be supported. It should be possible to configure the system to use NTP.

[2.3.](#) User Authentication

The authentication mechanism needs to support password authentication over RADIUS, to support deployment scenarios with centralized authentication servers. Additionally, local users need to be supported, for scenarios when no centralized authentication server exists, or for situations where the centralized authentication server cannot be reached from the device.

Since the mandatory transport protocol for NETCONF is SSH [[RFC6242](#)] the authentication model needs to support SSH's "publickey" and "password" authentication methods [[RFC4252](#)].

The model for authentication configuration should be flexible enough to support authentication methods defined by other standard documents or by vendors. It should be possible to configure the system authentication properties.

[2.4.](#) DNS Resolver

The configuration of the DNS resolver within the system containing the NETCONF server is required in order to control how domain names are resolved.

[2.5.](#) System Control

A few operations are needed to support common tasks such as restarting the device or setting the system date and time.

[3.](#) System Data Model

[3.1.](#) System Identification

The data model for system identification has the following structure:

```
+--rw system
|   +--rw contact?          string
```

```

|   +--rw hostname?          inet:domain-name
|   +--rw location?          string
+--ro system-state
|   +--ro platform
|       +--ro os-name?        string
|       +--ro os-release?     string
|       +--ro os-version?     string
|       +--ro machine?        string

```

3.2. System Time Management

The data model for system time management has the following structure:

```

+--rw system
|   +--rw clock
|   |   +--rw (timezone)?
|   |   |   +--:(timezone-name)
|   |   |   |   +--rw timezone-name?    timezone-name
|   |   |   +--:(timezone-utc-offset)
|   |   |   |   +--rw timezone-utc-offset?  int16
|   +--rw ntp!
|       +--rw enabled?    boolean
|       +--rw server* [name]
|           +--rw name                string
|           +--rw (transport)
|           |   +--:(udp)
|           |   |   +--rw udp
|           |   |   |   +--rw address    inet:host
|           |   |   |   +--rw port?     inet:port-number
|           +--rw association-type?    enumeration
|           +--rw iburst?              boolean
|           +--rw prefer?              boolean
+--ro system-state
|   +--ro clock
|       +--ro current-datetime?        yang:date-and-time
|       +--ro boot-datetime?           yang:date-and-time

```

New "case" statements can be added over time or augmented to the "transport" choice to support other transport protocols.

3.3. DNS Resolver Model

The data model for configuration of the DNS resolver has the following structure:

```

+--rw system
  +--rw dns-resolver
    +--rw search*      inet:domain-name
    +--rw server* [name]
      | +--rw name      string
      | +--rw (transport)
      |   +--:(udp-and-tcp)
      |     +--udp-and-tcp
      |       +--rw address      inet:ip-address
      |       +--rw port?        inet:port-number
    +--rw options
      +--rw timeout?      uint8
      +--rw attempts?     uint8

```

New "case" statements can be added over time or augmented to the "transport" choice to support other transport protocols.

[3.4.](#) RADIUS Client Model

The data model for configuration of the RADIUS client has the following structure:

```

+--rw system
  +--rw radius
    +--rw server* [name]
      | +--rw name          string
      | +--rw (transport)
      | | +--:(udp)
      | |   +--rw udp
      | |     +--rw address      inet:host
      | |     +--rw authentication-port?  inet:port-number
      | |     +--rw shared-secret  string
      | +--rw authentication-type?  identityref
    +--rw options
      +--rw timeout?      uint8
      +--rw attempts?     uint8

```

New "case" statements can be added over time or augmented to the "transport" choice to support other transport protocols.

[3.5.](#) User Authentication Model

This document defines three authentication methods for use with NETCONF:

- o publickey for local users over SSH
- o password for local users over any secure transport
- o password for RADIUS users over any secure transport

Additional methods can be defined by other standard documents or by vendors.

This document defines two optional YANG features, "local-users" and "radius-authentication", which the server advertises to indicate support for configuring local users on the device, and support for using RADIUS for authentication, respectively.

The authentication parameters defined in this document are primarily used to configure authentication of NETCONF users, but MAY also be used by other interfaces, e.g., a Command Line Interface or a Web-based User Interface.

The data model for user authentication has the following structure:

```
+--rw system
  +--rw authentication
    +--rw user-authentication-order*  identityref
    +--rw user* [name]
      +--rw name          string
      +--rw password?     ianach:crypt-hash
      +--rw authorized-key* [name]
        +--rw name          string
        +--rw algorithm     string
        +--rw key-data      binary
```

[3.5.1.](#) SSH Public Key Authentication

If the NETCONF server advertises the "local-users" feature, configuration of local users and their SSH public keys is supported in the /system/authentication/user list.

Public key authentication is requested by the SSH client. If the "local-users" feature is supported, then when a NETCONF client starts an SSH session towards the server using the "publickey"

authentication "method name" [[RFC4252](#)], the SSH server looks up the user name given in the SSH authentication request in the /system/

authentication/user list, and verifies the key as described in [[RFC4253](#)].

[3.5.2.](#) Local User Password Authentication

If the NETCONF server advertises the "local-users" feature, configuration of local users and their passwords is supported in the /system/authentication/user list.

For NETCONF transport protocols that support password authentication, the leaf-list "user-authentication-order" is used to control if local user password authentication should be used.

In SSH, password authentication is requested by the client. Other NETCONF transport protocols MAY also support password authentication.

When local user password authentication is requested, the NETCONF transport looks up the user name provided by the client in the /system/authentication/user list, and verifies the password.

[3.5.3.](#) RADIUS Password Authentication

If the NETCONF server advertises the "radius-authentication" feature, the device supports user authentication using RADIUS.

For NETCONF transport protocols that support password authentication, the leaf-list "user-authentication-order" is used to control if RADIUS password authentication should be used.

In SSH, password authentication is requested by the client. Other NETCONF transport protocols MAY also support password authentication.

[3.6.](#) System Control

The following operations are defined:

- set-current-datetime
- system-restart
- system-shutdown

Two protocol operations are included to restart or shutdown the system. The 'system-restart' operation can be used to restart the entire system (not just the NETCONF server). The 'system-shutdown' operation can be used to power off the entire system.

[4.](#) Relationship to the SNMPv2-MIB

If a device implements the SNMPv2-MIB [[RFC3418](#)], there are two objects that MAY be mapped by the implementation. See the YANG module definition in [Section 6](#) for details. The following table lists the YANG data nodes with corresponding objects in the SNMPv2-MIB.

+-----+-----+	
YANG data node	SNMPv2-MIB object
+-----+-----+	
contact	sysContact
location	sysLocation
+-----+-----+	

YANG interface configuration data nodes and related SNMPv2-MIB objects

  }
```

}

description

"The crypt-hash type is used to store passwords using a hash function. The algorithms for applying the hash function and encoding the result are implemented in various UNIX systems as the function crypt(3).

A value of this type matches one of the forms:

```
$0$<clear text password>
$<id>$<salt>$<password hash>
$<id>$<parameter>$<salt>$<password hash>
```

The '\$0\$' prefix signals that the value is clear text. When such a value is received by the server, a hash value is calculated, and the string '\$<id>\$<salt>\$' or '\$<id>\$<parameter>\$<salt>\$' is prepended to the result. This value is stored in the configuration data store.

If a value starting with '\$<id>\$', where <id> is not '0', is received, the server knows that the value already represents a hashed value, and stores it as is in the data store.

When a server needs to verify a password given by a user, it finds the stored password hash string for that user, extracts the salt, and calculates the hash with the salt and given password as input. If the calculated hash value is the same as the stored value, the password given by the client is accepted.

This type defines the following hash functions:

id	hash function	feature
1	MD5	crypt-hash-md5
5	SHA-256	crypt-hash-sha-256
6	SHA-512	crypt-hash-sha-512

The server indicates support for the different hash functions by advertising the corresponding feature.";

<CODE ENDS>

7. IANA Considerations

IANA is requested to create an IANA-maintained YANG Module called "iana-crypt-hash", based on the contents of [Section 5](#), which will allow for new hash algorithms to be added to the type "crypt-hash". The registration procedure will be Expert Review, as defined by [\[RFC5226\]](#).

This document registers two URIs in the IETF XML registry [\[RFC3688\]](#). Following the format in [RFC 3688](#), the following registrations are requested to be made.

URI: urn:ietf:params:xml:ns:yang:iana-crypt-hash
Registrant Contact: The IESG.
XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-system
Registrant Contact: The IESG.
XML: N/A, the requested URI is an XML namespace.

This document registers two YANG modules in the YANG Module Names registry [\[RFC6020\]](#).

name: iana-crypt-hash
namespace: urn:ietf:params:xml:ns:yang:iana-crypt-hash
prefix: ianach
reference: RFC XXXX

name: ietf-system

namespace: urn:ietf:params:xml:ns:yang:ietf-system
prefix: sys
reference: RFC XXXX

8. Security Considerations

The YANG modules defined in this memo are designed to be accessed via the NETCONF protocol [[RFC6241](#)]. The lowest NETCONF layer is the secure transport layer and the mandatory-to-implement secure transport is SSH [[RFC6242](#)]. Authorization for access to specific portions of conceptual data and operations within this module is provided by the NETCONF access control model (NACM) [[RFC6536](#)].

There are a number of data nodes defined in the "ietf-system" YANG module which are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations to these data nodes can have a negative effect on network operations. It is thus important to control write access (e.g., via edit-config) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

- o /system/clock/timezone: This choice contains the objects used to control the timezone used by the device.
- o /system/ntp: This container contains the objects used to control

the Network Time Protocol servers used by the device.

- o /system/dns-resolver: This container contains the objects used to control the Domain Name System servers used by the device.
- o /system/radius: This container contains the objects used to control the Remote Authentication Dial-In User Service servers used by the device.
- o /system/authentication/user-authentication-order: This leaf controls how user login attempts are authenticated by the device.
- o /system/authentication/user: This list contains the local users enabled on the system.

Some of the readable data nodes in the "ietf-system" YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

- o /system/platform: This container has objects which may help identify the specific NETCONF server and/or operating system implementation used on the device.

- o /system/authentication/user: This list has objects that may help identify the specific user names and password information in use on the device.

Some of the remote procedure call (RPC) operations in the "ietf-system" YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

- o set-current-datetime: Changes the current date and time on the device.
- o system-restart: Reboots the device.

- o system-shutdown: Shuts down the device.

Since this document describes the use of RADIUS for purposes of authentication, it is vulnerable to all of the threats that are present in other RADIUS applications. For a discussion of such threats, see [[RFC2865](#)] and [[RFC3162](#)], and [section 4 of \[RFC3579\]](#).

This document provides configuration parameters for SSH's "publickey" and "password" authentication mechanisms. [Section 9.4 of \[RFC4251\]](#) and [section 11 of \[RFC4252\]](#) discuss security considerations for these mechanisms.

The "iana-crypt-hash" YANG module defines a type "crypt-hash" that can be used to store MD5 hashes. [[RFC6151](#)] discusses security considerations for MD5. The usage of MD5 is NOT RECOMMENDED.

[9.](#) Change Log

-- RFC Ed.: remove this section before publication.

[9.1.](#) 00-01

- o added configuration-source identities

- o added configuration-source leaf to ntp and dns (via grouping) to choose configuration source
- o added association-type, iburst, prefer, and true leafs to the ntp-server list
- o extended the ssh keys for a user to a list of keys. support all defined key algorithms, not just dsa and rsa
- o clarified timezone-utc-offset description-stmt
- o removed '/system/ntp/server/true' leaf from data model

[9.2.](#) 01-02

- o added default-stmts to ntp-server/iburst and ntp-server/prefer leafs
- o changed timezone-location leaf to use iana-timezone typedef instead of a string

[9.3.](#) 02-03

- o removed configuration-source identities and leafs

[9.4.](#) 03-04

- o removed ndots dns resolver option
- o added radius-authentication-type identity, and identities for pap and chap, and a leaf to control which authentication type to use when communicating with the radius server
- o made 0 an invalid value for timeouts and attempts

[9.5.](#) 04-05

- o updated tree diagram explanation text

[9.6.](#) 05-06

- o changed ntp/use-ntp to ntp/enabled
- o changed ntp/ntp-server to ntp/server
- o removed /system/platform/nodename leaf
- o changed /system/name to /system/hostname
- o simplified must expression in user-authentication-order
- o added optional rounds to sha hash definition
- o clarified the crypt-hash description
- o clarified ntp descriptions
- o clarified YANG module description to indicate that some system properties are supported, not the entire system
- o clarified that system identification values are vendor specific, not the data node objects
- o clarified sec. 2.2 and 2.3 to indicate that the server should also be capable of configuring these properties
- o changed /system/dns/search from inet:host to inet:domain-name
- o changed [RFC6021](#) reference to 6021-bis
- o changed /system/platform/nodename to /system/platform/hostname
- o changed /system/radius/server/{leafs} to be within a choice and 'udp' case statement so other transport specific parameters can augment this list or they can be added by the WG to a future version of this module. {leafs} are authentication-port and shared-secret.
- o updated YANG tree diagrams for objects added in -05 and -06

[9.7.](#) 06-07

- o updated the Abstract and Introduction
- o updated Tree diagram notation

- o identify all external servers (dns, ntp, radius) by name instead of address, in order to make the data model extensible for additional transport protocol.
- o updated the Security Considerations section with a reference to NACM.

[9.8.](#) 07-08

- o renamed the DNS transport to 'udp-and-tcp' and added references.
- o moved the operational state nodes into /system-state.

[9.9.](#) 08-09

- o made "ntp" node a presence container
- o added reference to [RFC 6151](#)
- o updated reference from 6021-bis to [RFC 6991](#)
- o cleaned up usage of config false in the YANG module

[9.10.](#) 09-10

- o clarified relationship with SNMPv2-MIB

[9.11.](#) 11-12

- o added typedef "timezone-name", and removed reference to [draft-ietf-netmod-iana-timezones](#)

[9.12.](#) 13-14

- o moved the "crypt-hash" typedef to an IANA maintained module.
- o updated security considerations to mention RADIUS threats.

[9.13.](#) 14-15

- o updated security considerations to mention SSH authentication method threats.

[RFC1035] Mockapetris, P., "Domain names - implementation and specification", STD 13, [RFC 1035](#), November 1987.

[RFC1321] Rivest, R., "The MD5 Message-Digest Algorithm", [RFC 1321](#), April 1992.

[RFC2119] Bradner, S., "Key words for use in RFCs to Indicate Requirement Levels", [BCP 14](#), [RFC 2119](#), March 1997.

[RFC2865] Rigney, C., Willens, S., Rubens, A., and W. Simpson, "Remote Authentication Dial In User Service (RADIUS)", [RFC 2865](#), June 2000.

[RFC3162] Aboba, B., Zorn, G., and D. Mitton, "RADIUS and IPv6", [RFC 3162](#), August 2001.

[RFC3418] Presuhn, R., "Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)", STD 62, [RFC 3418](#), December 2002.

[RFC4251] Ylonen, T. and C. Lonvick, "The Secure Shell (SSH) Protocol Architecture", [RFC 4251](#), January 2006.

[RFC4252] Ylonen, T. and C. Lonvick, "The Secure Shell (SSH) Authentication Protocol", [RFC 4252](#), January 2006.

- [RFC4253] Ylonen, T. and C. Lonvick, "The Secure Shell (SSH) Transport Layer Protocol", [RFC 4253](#), January 2006.
- [RFC5226] Narten, T. and H. Alvestrand, "Guidelines for Writing an IANA Considerations Section in RFCs", [BCP 26](#), [RFC 5226](#), May 2008.
- [RFC5607] Nelson, D. and G. Weber, "Remote Authentication Dial-In

User Service (RADIUS) Authorization for Network Access Server (NAS) Management", [RFC 5607](#), July 2009.

- [RFC5966] Bellis, R., "DNS Transport over TCP - Implementation Requirements", [RFC 5966](#), August 2010.
- [RFC6020] Bjorklund, M., "YANG - A Data Modeling Language for the Network Configuration Protocol (NETCONF)", [RFC 6020](#), October 2010.
- [RFC6151] Turner, S. and L. Chen, "Updated Security Considerations for the MD5 Message-Digest and the HMAC-MD5 Algorithms", [RFC 6151](#), March 2011.
- [RFC6241] Enns, R., Ed., Bjorklund, M., Ed., Schoenwaelder, J., Ed., and A. Bierman, Ed., "Network Configuration Protocol (NETCONF)", [RFC 6241](#), June 2011.
- [RFC6242] Wasserman, M., "Using the NETCONF Protocol over Secure Shell (SSH)", [RFC 6242](#), June 2011.
- [RFC6536] Bierman, A. and M. Bjorklund, "Network Configuration Protocol (NETCONF) Access Control Model", [RFC 6536](#), March 2012.
- [RFC6991] Schoenwaelder, J., "Common YANG Data Types", [RFC 6991](#), July 2013.

[10.2.](#) Informative References

- [RFC3579] Aboba, B. and P. Calhoun, "RADIUS (Remote Authentication Dial In User Service) Support For Extensible

Authentication Protocol (EAP)", [RFC 3579](#), September 2003.

[RFC3688] Mealling, M., "The IETF XML Registry", [BCP 81](#), [RFC 3688](#), January 2004.

[RFC6557] Lear, E. and P. Eggert, "Procedures for Maintaining the Time Zone Database", [BCP 175](#), [RFC 6557](#), February 2012.

Bierman & Bjorklund

Expires November 15, 2014
