Reciprocal OAuth draft-ietf-oauth-reciprocal-00

Abstract

There are times when a user has a pair of protected resources that would like to request access to each other. While OAuth flows typically enable the user to grant a client access to a protected resource, granting the inverse access requires an additional flow. Reciprocal OAuth enables a more seamless experience for the user to grant access to a pair of protected resources.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of $\frac{BCP}{78}$ and $\frac{BCP}{79}$.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on November 27, 2018.

the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.

1. Introduction

In the usual three legged, authorization code grant, the OAuth flow enables a resource owner (user) to enable a client (party A) to be granted authorization to access a protected resource (party B). If party A also has a protected resource that the user would like to let party B access, then a second complete OAuth flow, but in the reverse direction, must be performed. In practice, this is a complicated user experience as the user is at Party A, but the OAuth flow needs to start from Party B. This requires the second flow to send the user back to party B, which then sends the user to Party A as the first step in the flow. At the end, the user is at Party B, even though the original flow started at Party A.

Reciprocal OAuth simplifies the user experience by eliminating the redirections in the second OAuth flow. After the intial OAuth flow, party A obtains consent from the user to grant party B access to a protected resource at party A, and then passes an authorization code to party B using the access token party A obtained from party B to provide party B the context of the user. Party B then exchanges the authorization code for an access token per the usual OAuth flow.

1.1. Terminology

In this document, the key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" are to be interpreted as described in $\underline{BCP\ 14}$, $\underline{RFC\ 2119}$ [RFC2119].

2. Reciprocal Scope Request

When party B is providing an authorization response per [RFC6749] 4.1.2, party B MAY include an additional query component in the redirection URI to indicate the scope requested in the reciprocal grant.

reciprocal OPTIONAL. The scope of party B's reciprocal access request per [RFC6749] 3.3.

If party B does not provide a reciprocal parameter in the authorization response, the reciprocal scope will be a value previously preconfigured by party A and party B.

3. Reciprocal Authorization Flow

The reciprocal authorization flow starts after the client (party A) has obtained an access token from the authorization server (party B) per [RFC6749] 4.1 Authorization Code Grant.

3.1. User Consent

Party A obtains consent from the user to grant Party B access to protected resources at party A. The consent represents the scopes party B had preconfigured at party A.

3.2. Reciprocal Authorization Code

Party A generates an authorization code representing the access granted to party B by the user. Party A then makes a request to party B's token endpoint authenticating per [RFC6749] 2.3 and sending the following parameters using the "application/x-www-form-urlencoded" format per [RFC6749] Appendix B with a character encoding of UTF-8 in the HTTP request entity-body:

grant_type REQUIRED. Value MUST be set to
"urn:ietf:params:oauth:grant-type:reciprocal".

code REQUIRED. The authorization code generated by party A.

client_id REQUIRED, party A'a client ID.

access_token REQUIRED, the access token obtained from Party B. Used to provide user context.

For example, the client makes the following HTTP request using TLS (with extra line breaks for display purposes only):

POST /token HTTP/1.1

Host: server.example.com

Authorization: Basic ej4hsyfishwssjdusisdhkjsdksusdhjkjsdjk

Content-Type: application/x-www-form-urlencoded

 $grant_type = urn \%3 A ietf \%3 Aparams \%3 Aoauth \%3 Agrant-$

type%3reciprocal&code=hasdyubasdjahsbdkjbasd&client_id=example.com&access_token=sadadojsadlkjasd

Party B MUST verify the authentication provided by Party A per [RFC6749] 2.3

Party B MUST then verify the access token was granted to the client identified by the client_id.

Party B MUST respond with either an HTTP 200 (OK) response if the request is valid, or an HTTP 400 "Bad Request" if it is not.

Party B then plays the role of the client to make an access token request per [RFC6749] 4.1.3.

4. IANA Considerations

TBD.

5. Acknowledgements

TBD.
