**Definitions of Managed Objects for Mapping SYSLOG Messages to Simple Network Management Protocol (SNMP) Notifications
draft-ietf-opsawg-syslog-msg-mib-06.txt**

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/lid-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on February 14, 2010.

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In

particular, it defines a mapping of SYSLOG messages to Simple Network Management Protocol (SNMP) notifications.

1. Introduction

[TOC](#)

SNMP [[RFC3410](#)] (Case, J., Mundy, R., Partain, D., and B. Stewart, "Introduction and Applicability Statements for Internet-Standard Management Framework," December 2002.) [[RFC3411](#)] (Harrington, D., Presuhn, R., and B. Wijnen, "An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks," December 2002.) and SYSLOG [[RFC5424](#)] (Gerhards, R., "The Syslog Protocol," March 2009.) are two widely used protocols to communicate event notifications. Although co-existence of several management protocols in one operational environment is possible, certain environments require that all event notifications are collected by a single system daemon such as a SYSLOG collector or an SNMP notification receiver via a single management protocol. In such environments, it is necessary to translate event notifications between management protocols.

This document defines an SNMP MIB module to represent SYSLOG messages and to send SYSLOG messages as SNMP notifications to SNMP notification receivers.

[TOC](#)

2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [\[RFC3410\]](#) (Case, J., Mundy, R., Partain, D., and B. Stewart, "Introduction and Applicability Statements for Internet-Standard Management Framework," December 2002.)

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, RFC 2578 [\[RFC2578\]](#) (McCloghrie, K., Perkins, D., and J. Schoenwaelder, "Structure of Management Information Version 2 (SMIV2)," April 1999.), STD 58, RFC 2579 [\[RFC2579\]](#) (McCloghrie, K., Perkins, D., and J. Schoenwaelder, "Textual Conventions for SMIV2," April 1999.) and STD 58, RFC 2580 [\[RFC2580\]](#) (McCloghrie, K., Perkins, D., and J. Schoenwaelder, "Conformance Statements for SMIV2," April 1999.) .

3. Conventions

[TOC](#)

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [\[RFC2119\]](#) (Bradner, S., "Key words for use in RFCs to Indicate Requirement Levels," March 1997.).

4. Overview

[TOC](#)

SYSLOG messages are translated to SNMP by a SYSLOG-to-SNMP translator. Such a translator acts as a SYSLOG collector [\[RFC5424\]](#) (Gerhards, R., "The Syslog Protocol," March 2009.) and implements a MIB module according to the SNMP architecture [\[RFC3411\]](#) (Harrington, D., Presuhn, R., and B. Wijnen, "An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks," December 2002.). The translator might be tightly coupled to an SNMP agent or it might interface with an SNMP agent via a subagent protocol. After initialization, the SYSLOG-to-SNMP translator will listen for SYSLOG messages. On receiving a message, the message will be parsed to extract information as described in the MIB module. A conceptual table is populated with information extracted from the SYSLOG message and finally a notification may be generated.

The MIB module is organized into a group of scalars and two tables. The syslogMsgControl group contains two scalars controlling the maximum size of SYSLOG messages recorded in the tables and whether SNMP notifications are generated for SYSLOG messages.

```
--syslogMsgObjects(1)
|
+--syslogMsgControl(1)
|
+-- Unsigned32 syslogMsgTableMaxSize(1)
+-- TruthValue syslogMsgEnableNotifications(2)
```

The syslogMsgTable contains one entry for each recorded SYSLOG message. The basic fields of SYSLOG messages as well as message properties are represented in different columns of the conceptual table.

```
--syslogMsgObjects(1)
|
+--syslogMsgTable(2)
|
+--syslogMsgEntry(1) [syslogMsgIndex]
|
+-- Unsigned32      syslogMsgIndex(1)
+-- SyslogFacility syslogMsgFacility(2)
+-- SyslogSeverity  syslogMsgSeverity(3)
+-- Unsigned32      syslogMsgVersion(4)
+-- SyslogTimeStamp syslogMsgTimeStamp(5)
+-- DisplayString   syslogMsgHostName(6)
+-- DisplayString   syslogMsgAppName(7)
+-- DisplayString   syslogMsgProcID(8)
+-- DisplayString   syslogMsgMsgID(9)
+-- Unsigned32      syslogMsgSDParams(10)
+-- OctetString     syslogMsgMsg(11)
```

The syslogMsgSDTable contains one entry for each structured data element parameter contained in a SYSLOG message. Since structured data elements are optional, the relationship between the syslogMsgTable and the syslogMsgSDTable ranges from one-to-zero to one-to-many.

```

--syslogMsgObjects(1)
|
+--syslogMsgSDTable(3)
|
+--syslogMsgSDEntry(1)      [syslogMsgIndex,
|                             syslogMsgSDParamIndex,
|                             syslogMsgSDID,
|                             syslogMsgSDParamName]
|
+-- Unsigned32              syslogMsgSDParamIndex(1)
+-- DisplayString           syslogMsgSDID(2)
+-- DisplayString           syslogMsgSDParamName(3)
+-- SyslogParamValueString  syslogMsgSDParamValue(4)

```

5. Relationship to Other MIB Modules

[TOC](#)

The NOTIFICATION-LOG-MIB [\[RFC3014\] \(Kavasserri, R., Ed., "Notification Log MIB," November 2002.\)](#) provides a generic mechanism for logging SNMP notifications in order to deal with lost SNMP notifications, e.g., due to transient communication problems. Applications can poll the notification log to verify that they have not missed important SNMP notifications.

The MIB module defined in this memo provides a mechanism for logging SYSLOG notifications. This additional SYSLOG notification log is provided because (a) SYSLOG messages might not lead to SNMP notification (this is configurable) and (b) SNMP notifications might not carry all information associated with a SYSLOG notification.

The MIB module IMPORTS objects from SNMPv2-SMI [\[RFC2578\] \(McCloghrie, K., Perkins, D., and J. Schoenwaelder, "Structure of Management Information Version 2 \(SMIV2\)," April 1999.\)](#), SNMPv2-TC [\[RFC2579\] \(McCloghrie, K., Perkins, D., and J. Schoenwaelder, "Textual Conventions for SMIV2," April 1999.\)](#), SNMPv2-CONF [\[RFC2580\] \(McCloghrie, K., Perkins, D., and J. Schoenwaelder, "Conformance Statements for SMIV2," April 1999.\)](#), SNMP-FRAMEWORK-MIB [\[RFC3411\] \(Harrington, D., Presuhn, R., and B. Wijnen, "An Architecture for Describing Simple Network Management Protocol \(SNMP\) Management Frameworks," December 2002.\)](#), and SYSLOG-TC-MIB [\[RFC5427\] \(Keeni, G., "Textual Conventions for Syslog Management," March 2009.\)](#).

[TOC](#)

6. Relationship to the SNMP Notification to SYSLOG Mapping

A companion document defines a mapping of SNMP notifications to SYSLOG messages [[I-D.ietf-opsawg-syslog-snmp](#)] ([Marinov, V. and J. Schoenwaelder, "Mapping Simple Network Management Protocol \(SNMP\) Notifications to SYSLOG Messages," March 2009.](#)). This section discusses the possibilities of using both specifications in combination.

A SYSLOG collector implementing the SYSLOG-MSG-MIB module and the mapping of SNMP notifications to SYSLOG messages may be configured to translate received SYSLOG messages containing SNMP notifications back into the original SNMP notification. In this case, the relevant tables of the SYSLOG-MSG-MIB will not be populated for SYSLOG messages carrying SNMP notifications. This configuration allows operators to build a forwarding chain where SNMP notifications are "tunneled" through SYSLOG messages. Due to size restrictions of the SYSLOG transports and the more verbose textual encoding used by SYSLOG, there is a possibility that SNMP notification content gets truncated while tunneled through SYSLOG and thus the resulting SNMP notification may be incomplete.

An SNMP management application supporting the SYSLOG-MSG-MIB and the mapping of SNMP notifications to SYSLOG messages may process information from the SYSLOG-MSG-MIB in order to emit a SYSLOG message representing the SYSLOG message recorded in the SYSLOG-MSG-MIB module. This configuration allows operators to build a forwarding chain where SYSLOG messages are "tunneled" through SNMP messages. A notification receiver can determine whether a `syslogMsgNotification` contained all structured data element parameters of a SYSLOG message. In case parameters are missing, a forwarding application MUST retrieve the missing parameters from the SYSLOG-MSG-MIB. Regular polling of the SYSLOG-MSG-MIB can be used to take care of any lost SNMP notifications.

STATUS current

DESCRIPTION

"A date-time specification. This type is similar to the DateAndTime type defined in the SNMPv2-TC except that the subsecond granulation is microseconds instead of deciseconds and that a zero-length string can be used to indicate a missing value.

field	octets	contents	range
-----	-----	-----	-----

1	1-2	year*	0..65536
2	3	month	1..12
3	4	day	1..31
4	5	hour	0..23
5	6	minutes	0..59
6	7	seconds	0..60
		(use 60 for leap-second)	
7	8-10	microseconds	0..999999
8	11	direction from UTC	'+' / '-'
9	12	hours from UTC*	0..13
10	13	minutes from UTC	0..59

* Notes:

- the value of year is in network-byte order
- the value of microseconds is in network-byte order
- daylight saving time in New Zealand is +13

For example, Tuesday May 26, 1992 at 1:30:15 PM EDT would be displayed as:

1992-5-26,13:30:15.0,-4:0

Note that if only local time is known, then timezone information (fields 11-13) is not present."

SYNTAX OCTET STRING (SIZE (0 | 10 | 13))

SyslogParamValueString ::= TEXTUAL-CONVENTION

DISPLAY-HINT "65535t"

STATUS current

DESCRIPTION

"The value of a SYSLOG SD-PARAM is represented using the ISO/IEC IS 10646-1 character set, encoded as an octet string using the UTF-8 transformation format described in RFC3629.

Since additional code points are added by amendments to the 10646 standard from time to time, implementations must be prepared to encounter any code point from 0x00000000 to 0x7fffffff. Byte sequences that do not correspond to the valid UTF-8 encoding of a code point or are outside this range are prohibited. Similarly, overlong UTF-8 sequences are prohibited.

UTF-8 may require multiple bytes to represent a single character / code point; thus the length of this object in octets may be different from the number of characters encoded. Similarly, size constraints refer to the number of encoded octets, not the number of characters represented by an encoding."

```

 ::= { syslogMsgEntry 10 }

syslogMsgMsg OBJECT-TYPE
    SYNTAX      OCTET STRING
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
        "The message part of the syslog message. The syntax does not
        impose a size restriction. Implementations of this MIB module
        may truncate the message part of the syslog message such that
        it fits into the size constraints imposed by the implementation
        environment. Such truncations can also happen elsewhere in the
        syslog forwarding chain.

        If the first octets contain the value 'EFBBBF'h, then the rest
        of the message is a UTF-8 string. Since syslog messages may be
        truncated at arbitrary octet boundaries during forwarding, the
        message may contain invalid UTF-8 encodings at the end."

```

8. Usage Example

[TOC](#)

The following example shows a valid syslog message including structured data. The otherwise-unprintable Unicode BOM is represented as "BOM" in the example.

```

<165>1 2003-10-11T22:14:15.003Z mymachine.example.com
eventslog - ID47 [exampleSDID@32473 iut="3" eventSource="Application"
eventID="1011"] BOMAn application event log entry...

```

This syslog message leads to the following entries in the syslogMsgTable and the syslogMsgSDTable (note that string indexes are written as strings for readability reasons):

```
syslogMsgIndex.1 = 1
syslogMsgFacility.1 = 20
syslogMsgSeverity.1 = 5
syslogMsgVersion.1 = 1
syslogMsgTimeStamp.1 = 2003-10-11, 22:14:15.003, +0:0
syslogMsgHostName.1 = "mymachine.example.com"
syslogMsgAppName.1 = "evntslog"
syslogMsgProcID.1 = "-"
syslogMsgMsgID.1 = "ID47"
syslogMsgMsg.1 = "BOMAn application event log entry..."
syslogMsgSDParamValue.1.1."exampleSDID@32473"."iut"
    = "3"
syslogMsgSDParamValue.1.2."exampleSDID@32473"."eventSource"
    = "Application"
syslogMsgSDParamValue.1.3."exampleSDID@32473"."eventID"
    = "1011"
```

9. IANA Considerations

[TOC](#)

The IANA is requested to assign a value for "XXX" under the 'mib-2' subtree and to record the assignment in the SMI Numbers registry. When the assignment has been made, the RFC Editor is asked to replace "XXX" (here and in the MIB module) with the assigned value.

10. Security Considerations

[TOC](#)

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations. These are the tables and objects and their sensitivity/vulnerability:

*syslogMsgTableMaxSize: This object controls how many entries are kept in the syslogMsgTable. Unauthorized modifications may either cause increased memory consumption (by setting this object to a large value) or turn off the capability to retrieve notifications using GET class operations (by setting this object to zero). This might be used to hide traces of an attack.

*syslogMsgEnableNotifications: This object enables notifications. Unauthorized modifications to disable notification generation can

be used to hide an attack by preventing management applications that use SNMP from receiving real-time notifications about events carried in syslog messages. Unauthorized modifications to enable notification generation may be used as part of a denial of service attack against a network management system if for example the SYSLOG-to-SNMP translator accepts unauthorized syslog messages.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

*syslogMsgTableMaxSize, syslogMsgEnableNotifications: These objects provide information whether SYSLOG messages are forwarded as SNMP notifications and how many messages will be maintained in the syslogMsgTable. This information might be exploited by an attacker in order to plan actions with the goal of hiding attack activities.

*syslogMsgFacility, syslogMsgSeverity, syslogMsgVersion, syslogMsgTimeStamp, syslogMsgHostName, syslogMsgAppName, syslogMsgProcID, syslogMsgMsgID, syslogMsgSDParams, syslogMsgMsg, syslogMsgSDParamValue: These objects carry the content of syslog messages and the syslog message oriented security considerations of [\[RFC5424\] \(Gerhards, R., "The Syslog Protocol," March 2009.\)](#) apply. In particular, an attacker who gains access to SYSLOG messages via SNMP may use the knowledge gained from SYSLOG messages to compromise a machine or do other damage. It is therefore desirable to configure SNMP access control rules enforcing a consistent security policy for SYSLOG messages.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to

those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

Using the security features of the SNMPv3 framework secures the transport of SYSLOG data via SNMP only. It is therefore RECOMMENDED that deployments use SYSLOG security mechanisms in order to prevent attackers from adding malicious SYSLOG data to the MIB tables.

11. Acknowledgments

[TOC](#)

The editors wish to thank the following individuals for providing helpful comments on various versions of this document: Martin Bjorklund, Washam Fan, Rainer Gerhards, Wes Hardacker, David Harrington, Tom Petch, Juergen Quittek, Dan Romascanu, and Bert Wijnen.
