**Advertising Tunneling Capability in OSPF  
draft-ietf-ospf-encapsulation-cap-03**

Abstract

Networks use tunnels for a variety of reasons. A large variety of tunnel types are defined and the ingress needs to select a type of tunnel which is supported by the egress and itself. This document defines how to advertise egress tunnel capabilities in OSPF Router Information Link State Advertisement (LSAs).

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on November 20, 2017.

**1. Introduction**

Networks use tunnels for a variety of reasons, such as:

- o Partial deployment of MPLS-SPRING as described in [[I-D.xu-mpls-unified-source-routing-instruction](#)], where IP tunnels are used between MPLS-SPRING-enabled routers to traverse non-MPLS routers.

- o Partial deployment of MPLS-BIER as described in [[I-D.ietf-bier-architecture](#)], where IP tunnels are used between MPLS-BIER-capable routers to traverse non MPLS-BIER [[I-D.ietf-bier-mpls-encapsulation](#)] routers.
- o Partial deployment of IPv6 in IPv4 networks or IPv6 in IPv4 networks as described in [[RFC5565](#)], where IPvx tunnels are used between IPvx-enabled routers so as to traverse non-IPvx routers.
- o Remote Loop-Free Alternate (RLFA) repair tunnels as described in [[RFC7490](#)], where tunnels are used between the Point of Local Repair and the selected PQ node.

The ingress needs to select a type of tunnel which is supported by the egress and itself. This document describes how to use OSPF Router Information Link State Advertisements (LSAs) to advertise the egress tunneling capabilities of OSPF routers. In this document, OSPF refers to both OSPFv2 and OSPFv3.

## **2. Terminology**

This memo makes use of the terms defined in [[RFC7770](#)].

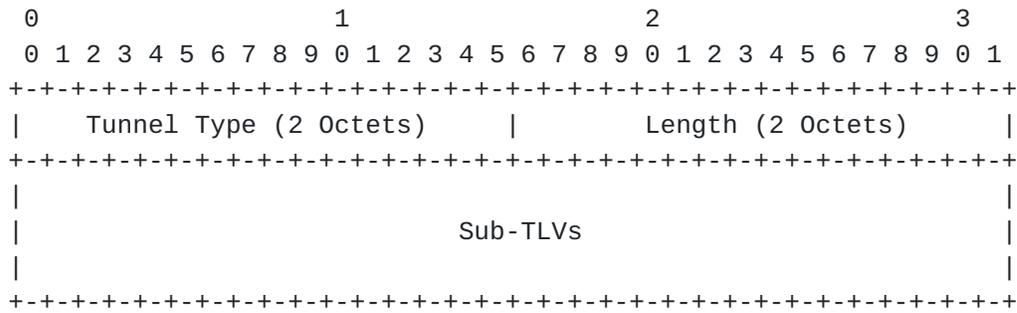

## **3. Advertising Encapsulation Capability**

Routers advertise their supported encapsulation type(s) by advertising a new TLV of the OSPF Router Information (RI) Opaque LSA [[RFC7770](#)], referred to as the Encapsulation Capability TLV. This TLV is applicable to both OSPFv2 and OSPFv3. The Encapsulation Capability TLV SHOULD NOT appear more than once within a given OSPF Router Information (RI) Opaque LSA. If the Encapsulation Capability TLV appears more than once in an OSPF Router Information LSA, only the first occurrence MUST be processed and others MUST be ignored. The scope of the advertisement depends on the application but it is recommended that it SHOULD be domain-wide. The Type code of the Encapsulation Capability TLV is TBD1, the Length value is variable, and the Value field contains one or more Tunnel Encapsulation Type Sub-TLVs. Each Encapsulation Type Sub-TLVs indicates a particular encapsulation format that the advertising router supports.

## **4. Tunnel Encapsulation Type**

The Tunnel Encapsulation Type Sub-TLV is structured as follows:

Tunnel Type (2 octets): Identifies the type of tunneling technology being signaled. This document defines the following types:

1. L2TPv3 over IP [[RFC3931](#)] : Type code=1;
2. GRE [[RFC2784](#)] : Type code=2;
3. Transmit tunnel endpoint [[RFC5566](#)] : Type code=3;
4. IPsec in Tunnel-mode [[RFC5566](#)] : Type code=4;
5. IP-in-IP tunnel with IPsec Transport Mode [[RFC5566](#)] : Type code=5;
6. MPLS-in-IP tunnel with IPsec Transport Mode [[RFC5566](#)] : Type code=6;
7. IP-in-IP [[RFC2003](#)] [[RFC4213](#)]: Type code=7;
8. VXLAN [[RFC7348](#)] : Type code=8;
9. NVGRE [[RFC7637](#)] : Type code=9;
10. MPLS [[RFC3032](#)] : Type code=10;
11. MPLS-in-GRE [[RFC4023](#)] : Type code=11;
12. VXLAN GPE [[I-D.ietf-nvo3-vxlan-gpe](#)] : Type code=12;
13. MPLS-in-UDP [[RFC7510](#)] : Type code=13;
14. MPLS-in-UDP-with-DTLS [[RFC7510](#)] : Type code=14;
15. MPLS-in-L2TPv3 [[RFC4817](#)] : Type code=15;
16. GTP: Type code=16;

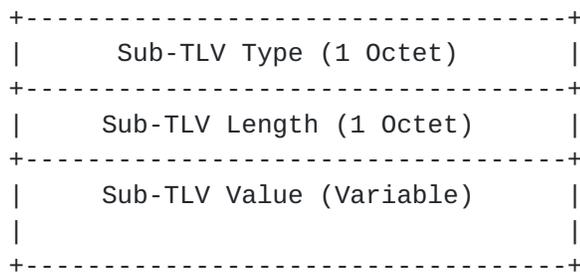

Unknown types are to be ignored and skipped upon receipt.

Length (2 octets): Unsigned 16-bit integer indicating the total number of octets of the value field.

Value (variable): Zero or more Tunnel Encapsulation Attribute Sub-TLVs as defined in [Section 5](#).

**5. Tunnel Encapsulation Attribute**

The Tunnel Encapsulation Attribute Sub-TLV is structured as follows:

Sub-TLV Type (1 octet): Each Sub-TLV type defines a certain property of the tunnel TLV that contains this Sub-TLV. The following are the types defined in this document:

1. Encapsulation: Sub-TLV type = 1; (See [Section 5.1](#))
2. Protocol Type: Sub-TLV type = 2; (See [Section 5.2](#))
3. Endpoint: Sub-TLV type = 3; (See [Section 5.3](#))
4. Color: Sub-TLV type = 4; (See [Section 5.4](#))

Sub-TLV Length (1 octet): Unsigned 8-bit integer indicating the total number of octets of the Sub-TLV value field.

Sub-TLV Value (variable): Encodings of the value field depend on the Sub-TLV type as enumerated above. The following sub-sections define the encoding in detail.

Any unknown Sub-TLVs MUST be ignored and skipped upon receipt. However, if the TLV is understood, the entire TLV MUST NOT be ignored just because it contains an unknown Sub-TLV.

If a Sub-TLV is invalid, this specific Tunnel Encapsulation MUST be ignored and skipped. However, other Tunnel Encapsulations MUST be considered.

**5.1. Encapsulation Sub-TLV**

This Sub-TLV has its format defined in [RFC5512] and [I-D.ietf-idr-tunnel-encaps] under the name Encapsulation Sub-TLV.

**5.2. Protocol Type Sub-TLV**

This Sub-TLV has its format defined in [RFC5512] and [I-D.ietf-idr-tunnel-encaps] under the name Protocol Type.

**5.3. Endpoint Sub-TLV**

The value field carries the Network Address to be used as tunnel destination address.

If length is 4, the tunnel endpoint is an IPv4 address.

If length is 16, the tunnel endpoint is an IPv6 address.

**5.4. Color Sub-TLV**

The valued field is a 4-octet opaque unsigned integer.

The color value is user defined and configured locally on the advertising routers. It may be used by service providers to define policies.

**6. IANA Considerations**

**6.1. OSPF Router Information**

This document requests IANA to allocate a new code point from the OSPF Router Information (RI) registry.

Value	TLV Name	Reference
-----	-----	-----
TBD1	Tunnel Capabilities	This document

**6.2. IGP Tunnel Encapsulation Types Registry**

This document requests IANA to create a new registry "IGP Tunnel Encapsulation Types" with the following registration procedure:

Registry Name: IGP Tunnel Encapsulation Type

Value	Name	Reference
0	Reserved	This document
1	L2TPv3 over IP	This document
2	GRE	This document
3	Transmit tunnel endpoint	This document
4	IPsec in Tunnel-mode	This document
5	IP-in-IP tunnel with IPsec Transport Mode	This document
6	MPLS-in-IP tunnel with IPsec Transport Mode	This document
7	IP-in-IP	This document
8	VXLAN	This document
9	NVGRE	This document
10	MPLS	This document
11	MPLS-in-GRE	This document
12	VXLAN-GPE	This document
13	MPLS-in-UDP	This document
14	MPLS-in-UDP-with-DTLS	This document
15	MPLS-in-L2TPv3	This document
16	GTP	This document
17-250	Unassigned	
251-254	Experimental	This document
255	Reserved	This document

Assignments of Encapsulation Types are via Standards Action [[RFC5226](#)].

**6.3. IGP Tunnel Encapsulation Attribute Types Registry**

This document requests IANA to create a new registry "IGP Tunnel Encapsulation Attribute Types" with the following registration procedure:

Registry Name: IGP Tunnel Encapsulation Attribute Types

Value	Name	Reference
0	Reserved	This document
1	Encapsulation	This document
2	Protocol Type	This document
3	Endpoint	This document
4	Color	This document
5-250	Unassigned	
251-254	Experimental	This document
255	Reserved	This document

Assignments of Encapsulation Attribute Types are via Standards Action [[RFC5226](#)].

## **7. Security Considerations**

Security considerations applicable to softwires can be found in the mesh framework [[RFC5565](#)]. In general, security issues of the tunnel protocols signaled through this OSPF capability extension are inherited.

If a third-party is able to modify any of the information that is used to form encapsulation headers, to choose a tunnel type, or to choose a particular tunnel for a particular payload type, user data packets may end up getting misrouted, misdelivered, and/or dropped.

Security considerations for the base OSPF protocol are covered in [[RFC2328](#)] and [[RFC5340](#)].
