Yang Data Model for OSPF Protocol
draft-ietf-ospf-yang-09

Abstract

This document defines a YANG data model that can be used to configure and manage OSPF.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 3, 2018.

[1.](#) Overview

YANG [[RFC6020](#)] is a data definition language used to define the contents of a conceptual data store that allows networked devices to be managed using NETCONF [[RFC6241](#)]. YANG is proving relevant beyond its initial confines, as bindings to other interfaces (e.g., ReST) and encodings other than XML (e.g., JSON) are being defined. Furthermore, YANG data models can be used as the basis for implementation of other interfaces, such as CLI and programmatic APIs.

This document defines a YANG data model that can be used to configure and manage OSPF and it is an augmentation to the core routing data model. A core routing data model is defined in [[RFC8022](#)], and it

provides the basis for the development of data models for routing protocols. The interface data model is defined in [\[RFC7223\]](#) and is used for referencing interfaces from the routing protocol. The key-chain data model used for OSPF authentication is defined in [\[RFC8177\]](#)

and provides both a reference to configured key-chains and an enumeration of cryptographic algorithms.

Both OSPFv2 [\[RFC2328\]](#) and OSPFv3 [\[RFC5340\]](#) are supported. In addition to the core OSPF protocol, features described in other OSPF RFCs are also supported. These includes demand circuit [\[RFC1793\]](#), traffic engineering [\[RFC3630\]](#), multiple address family [\[RFC5838\]](#), graceful restart [\[RFC3623\]](#) [\[RFC5187\]](#), NSSA [\[RFC3101\]](#), and OSPF(v3) as a PE-CE Protocol [\[RFC4577\]](#), [\[RFC6565\]](#). These non-core features are optional in the OSPF data model.

[1.1.](#) Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [\[RFC2119\]](#).

[2.](#) Design of Data Model

Although the basis of OSPF configuration elements like routers, areas, and interfaces remains the same, the detailed configuration model varies among router vendors. Differences are observed in terms of how the protocol engine is tied to the routing domain, how multiple protocol engines are be instantiated among others.

The goal of this document is to define a data model that provides a common user interface to the OSPFv2 and OSPFv3 protocols. There is very little information that is designated as "mandatory", providing freedom for vendors to adapt this data model to their respective product implementations.

[2.1.](#) OSPF Operational State

The OSPF operational state is included in the same tree as OSPF configuration consistent with Network Management Datastore Architecture [\[I-D.ietf-netmod-revised-datastores\]](#). Consequently,

only the routing container in the ietf-routing model [\[RFC8022\]](#) is augmented. The routing-state container is not augmented.

[2.2.](#) Overview

The OSPF YANG module defined in this document has all the common building blocks for the OSPF protocol.

The OSPF YANG module augments the /routing/control-plane-protocols/control-plane-protocol path defined in the ietf-routing module.

```
module: ietf-ospf
  augment /rt:routing/rt:control-plane-protocols/
    rt:control-plane-protocol:
      +--rw ospf
        .
        .
        +--rw operation-mode?          identityref
        +--rw instance* [af]
          .
          .
          +--rw areas
            | +--rw area* [area-id]
            |   +--rw area-id          area-id-type
            |   .
            |   .
            |   +--rw virtual-links
            |     | +--rw virtual-link* [transit-area-id router-id]
            |     | .
            |     | .
            |     +--rw sham-links {pe-ce-protocol}?
            |       | +--rw sham-link* [local-id remote-id]
            |       | .
            |       | .
            |       +--rw interfaces
            |         +--rw interface* [name]
            |         .
            |         .
            +--rw topologies {multi-topology}?
              +--rw topology* [name]
```

.

.

The ospf module is intended to match to the vendor specific OSPF configuration construct that is identified by the local identifier 'name'. The field 'version' allows support for OSPFv2 and OSPFv3.

The ospf container includes one or more OSPF protocol engines, each enclosed in a separate instance entity. Each instance includes information for the routing domain based on the [routing-instance af] specification. There is no default routing domain assumed by the data model. For example, to enable OSPF on a vendor's default IPv4 routing domain, an explicit instance entity with a specification like ["default" "ipv4-unicast"] is required. The instance also contains OSPF router level configuration and operational state.

The instance/area and instance/area/interface containers respectively define the OSPF configuration and operational state for OSPF areas and interfaces.

The instance/topology container defines the OSPF configuration and operational state for OSPF topologies when the multi-topology feature is supported.

[2.3.](#) OSPFv2 and OSPFv3

The data model defined herein supports both OSPFv2 and OSPFv3.

The field 'version' is used to indicate the OSPF version and is mandatory. Based on the configured version, the data model varies to accommodate the differences between OSPFv2 and OSPFv3.

[2.4.](#) Optional Features

Optional features are beyond the basic OSPF configuration and it is the responsibility of each vendor to decide whether to support a given feature on a particular device.

This model defines a number of features, such as NSR, max-LSA, etc. It is expected that vendors will support additional features through vendor-specific augmentations.

[2.5.](#) OSPF Router Configuration/Operational State

The ospf container is the top level container in this data model. It contains shared information among the OSPF instances configured within the container.

```
module: ietf-ospf
  augment /rt:routing/rt:control-plane-protocols/
    rt:control-plane-protocol:
      +--rw ospf
        +--rw operation-mode?          identityref
        +--rw instance* [af]
          .
          .
```

[2.6.](#) OSPF Instance Configuration/Operational State

The instance container represents an OSPF protocol engine and contains the router level configuration and operational state. The routing domain for each instance is dictated through the specification of [routing-instance af]. The instance level operational state includes the instance level statistics, IETF SPF delay statistics, AS-Scoped Link State Database, local RIB, SPF Log, and the LSA log.

```
module: ietf-ospf

2.9. OSPF notification

This YANG model defines a list of notifications that inform YANG clients of important events detected during protocol operation. The defined notifications cover the common set of traps from the OSPFv2 MIB [[RFC4750](#)] and OSPFv3 MIB [[RFC5643](#)].

notifications:

```

+---n if-state-change
|   +---ro routing-protocol-name?
|   |   + -> /rt:routing/control-plane-protocols/
|   |   +       control-plane-protocol/name

[2.10.](#) OSPF RPC Operations

The "ietf-ospf" module defines two RPC operations:

- o clear-database: reset the content of a particular OSPF database.
- o clear-neighbor: restart a particular set of OSPF neighbor.

```

rpcs:
  +---x clear-neighbor
  |   +---w input
  |       +---w routing-protocol-name
  |       +      -> /rt:routing/control-plane-protocols/
  |       +          control-plane-protocol/name
  |       +---w interface?                if:interface-ref
  +---x clear-database
      +---w input
          +---w routing-protocol-name
              -> /rt:routing/control-plane-protocols/

```

3. OSPF Yang Module

```

<CODE BEGINS> file "ietf-ospf@2017-10-30.yang"
module ietf-ospf {
  namespace "urn:ietf:params:xml:ns:yang:ietf-ospf";

  prefix ospf;

}

revision 2016-10-31 {
    description
        "* Update authors information.
        * Rename candidate-disabled to candidate-enable
          and set the default value to TRUE.
        * Rename node identifiers that end with
          'enabled' to 'enable'.
        * Set the default value of
          ospf/instance/areas/area/interfaces/interface/
          fast-reroute/lfa/enable (previously named 'enabled')
          to FALSE.
        * Set the default value of
          ospf/instance/areas/area/interfaces/interface/
          fast-reroute/remote-lfa/enable (previously named 'enabled')
          to FALSE.
        * Rename
          ospf/instance/areas/area/interfaces/interface/
          static-neighbors/neighbor/address to 'identifier'
          with type inet:ip-address
        * Add 'dead-timer' to
          ospf-state/instance/areas/area/interfaces/interface/
          neighbors/neighbor.
        * Remove 'mtu-ignore' and 'prefix-suppression' from
          virtual-link configuration.
        * Adjust range specifications from 'transmit-delay',
          'dead-interval', and 'retransmit-interval' in
          ospf/instance/areas/area/interfaces/interface.
        * Change the type of
          ospf/instance/areas/area/interface/interface/dead-interval
          to uint32 to match RFC2328 Appendix A.3.2.
        * Change hello-timer and wait-timer unit to seconds.
        * Update hello-timer, dead-timer and wait-timer descriptions.
        * Add IEEE bandwidth type and update all TE bandwidth fields
          to use it.
        * Add Nt-bit to OSPFv2 router LSA.
        * Remove L-bit from OSPFv2 router LSA.

Internet-Draft

OSPF Yang Data Model

October 2017

```
description
  "* Add ospfv3 AF bit.
  * Add ospfv2 MT, L, O, DN bit.
  * Add interface priority config.
  * Change bdr-ip-address to type ip-address.
  * Rename leaf interface to name.
  * Rename rx-bad-packet to if-rx-bad-packet.
  * Move virtual link placement to backbone area.
  * Remove cost configuration from virtual link.
  * Move if-feature multi-area-adj statement.
  * Add type checksum16-type.
  * Change LSA header checksum to use checksum16-type.
  * Change routing-protocol to control-plane-protocol.
  * Change import module name to ietf-key-chain.";
reference
  "RFC XXXX: A YANG Data Model for OSPF.";
}

revision 2016-03-20 {
  description
    "* Reorganize *-config and *-operation groupings.
    * Use *-config under state tree for applied config.
    * Rename config router-id to explicit-router-id.
    * Rename feature router-id to explicit-router-id.
    * Add OSPFv3 instance ID.
    * Add OSPFv3 interface ID.
    * Add ip-address for DR and BDR.
    * Remove routing-instance.
    * Change import module name to ietf-routing-key-chain.";

```

```
  "* Author information update.
   * Editorial changes";
reference
  "RFC XXXX: A YANG Data Model for OSPF.";
}

revision 2015-07-06 {
  description
    "* Remove support for protocol-centric config.
     * Enclose list in container, except for instance.
     * Replace protocol-shutdown with admin-control.
     * Add IP-FRR per-interface config.
     * Reorganize max-path etc node.
     * Add node-flag.
     * Align config/operation hierarchy.
     * Use relative path for reference to rib.
     * Add ability to set single admin distance.
     * Make unreserved bandwidth into list.
     * Add F and T bit to OSPFv3 external LSA.
     * Remove key statement inside LSA body.
     * Add stub router support.
     * Fix usage of af-area-config.
     * Add statistics to operation data.
     * Add local rib.
     * Use dotted-quad for all router-id fields.
     * Support more than one multi-area per interface.
     * Use uint16 for LSA type.
     * Update grouping notification-instance-hdr.
     * Rework condition for opaque type and id in OSPFv2 LSA.
     * Rename local-remote-ipv4-addr with remote-if-ipv4-addr.
     * Add virtual-link/sham-link to operation state.
     * Allow multiple link TLVs in one LSA.
     * Fix bug in as-scope-lsas.
     * Remove OSPFv3 restriction in link-scope-lsas.
     * Editorial changes.";
```

[4.](#) Security Considerations

The YANG module defined in this document is designed to be accessed via network management protocols such as NETCONF [[RFC6241](#)] or RESTCONF [[RFC8040](#)]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [[RFC6242](#)]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [[RFC5246](#)].

The NETCONF access control model [[RFC6536](#)] provides the means to restrict access for particular NETCONF or RESTCONF users to a pre-configured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. For OSPF, the ability to modify OSPF configuration will allow the entire OSPF domain to be compromised including peering with unauthorized routers to misroute traffic or mount a massive Denial-of-Service (DoS) attack. The security considerations of OSPFv2 [[RFC2328](#)] and [[RFC5340](#)].

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. The exposure of the Link State Database (LSDB) will expose the detailed topology of the network. This may be undesirable since both due to the fact that exposure may

facilitate other attacks. Additionally, network operators may consider their topologies to be proprietary.

For OSPF authentication, configuration is supported via the specification of key-chains [[RFC8177](#)] or the direct specification of key and authentication algorithm. Hence, authentication configuration using the "auth-table-trailer" case in the "authentication" container inherits the security considerations of [[RFC8177](#)]. This includes the considerations with respect to the local storage and handling of authentication keys.

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. The OSPF Yang module support the "clear-neighbor" and "clear-database" RPCs. If access too either of these is compromised, they can result in temporary network outages be employed to mount DoS attacks.
