# A YANG Data Model for Path Computation Element Communications Protocol (PCEP)
## draft-ietf-pce-pcep-yang-08

Abstract

This document defines a YANG data model for the management of Path Computation Element communications Protocol (PCEP) for communications between a Path Computation Client (PCC) and a Path Computation Element (PCE), or between two PCEs. The data model includes configuration data and state data (status information and counters for the collection of statistics).

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on December 24, 2018.

Table of Contents

## 1. Introduction

The Path Computation Element (PCE) defined in [RFC4655] is an entity that is capable of computing a network path or route based on a network graph, and applying computational constraints. A Path

Computation Client (PCC) may make requests to a PCE for paths to be computed.

PCEP is the communication protocol between a PCC and PCE and is defined in [RFC5440]. PCEP interactions include path computation requests and path computation replies as well as notifications of specific states related to the use of a PCE in the context of Multiprotocol Label Switching (MPLS) and Generalized MPLS (GMPLS) Traffic Engineering (TE). [RFC8231] specifies extensions to PCEP to enable stateful control of MPLS TE LSPs.

This document defines a YANG [RFC6020] data model for the management of PCEP speakers. It is important to establish a common data model for how PCEP speakers are identified, configured, and monitored. The data model includes configuration data and state data (status information and counters for the collection of statistics).

This document contains a specification of the PCEP YANG module, "ietf-pcep" which provides the PCEP [RFC5440] data model.

The PCEP operational state is included in the same tree as the PCEP configuration consistent with Network Management Datastore Architecture [RFC8342]. The origin of the data is indicated as per the origin metadata annotation.

## 2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

## 3. Terminology and Notation

This document uses the terminology defined in [RFC4655] and [RFC5440]. In particular, it uses the following acronyms.

- Path Computation Request message (PCReq).
- Path Computation Reply message (PCRep).
- Notification message (PCNtf).
- Error message (PCErr).
- Request Parameters object (RP).

- Synchronization Vector object (SVEC).
- Explicit Route object (ERO).

This document also uses the following terms defined in [RFC7420]:

- PCEP entity: a local PCEP speaker.
- PCEP peer: to refer to a remote PCEP speaker.
- PCEP speaker: where it is not necessary to distinguish between local and remote.

Further, this document also uses the following terms defined in [RFC8231] :

- Stateful PCE, Passive Stateful PCE, Active Stateful PCE
- Delegation, Revocation, Redelegation
- LSP State Report, Path Computation Report message (PCRpt).
- LSP State Update, Path Computation Update message (PCUpd).

[RFC8281] :

- PCE-initiated LSP, Path Computation LSP Initiate Message (PCInitiate).

[I-D.ietf-pce-lsp-setup-type] :

- Path Setup Type (PST).

[I-D.ietf-pce-segment-routing] :

- Segment Routing (SR).

### 3.1. Tree Diagrams

A simplified graphical representation of the data model is used in this document. The meaning of the symbols in these diagrams is defined in [RFC8340].

### 3.2. Prefixes in Data Node Names

In this document, names of data nodes and other data model objects are often used without a prefix, as long as it is clear from the context in which YANG module each name is defined. Otherwise, names

are prefixed using the standard prefix associated with the corresponding YANG module, as shown in Table 1.

| Prefix | YANG module | Reference |
|---|---|---|
| yang | ietf-yang-types | [RFC6991] |
| inet | ietf-inet-types | [RFC6991] |
| te | ietf-te | [I-D.ietf-teas-yang-te] |
| te-types | ietf-te-types | [I-D.ietf-teas-yang-te] |
| key-chain | ietf-key-chain | [RFC8177] |
| nacm | ietf-netconf-acm | [RFC8341] |
| tls-server | ietf-tls-server | [I-D.ietf-netconf-tls-client-server] |
| tls-client | ietf-tls-client | [I-D.ietf-netconf-tls-client-server] |

Table 1: Prefixes and corresponding YANG modules

## 4. Objectives

This section describes some of the design objectives for the model:

- In case of existing implementations, it needs to map the data model defined in this document to their proprietary native data model. To facilitate such mappings, the data model should be simple.

- The data model should be suitable for new implementations to use as is.

- Mapping to the PCEP MIB Module should be clear.

- The data model should allow for static configurations of peers.

- The data model should include read-only counters in order to gather statistics for sent and received PCEP messages, received messages with errors, and messages that could not be sent due to errors. This could be in a separate model which augments the base data model.

- It should be fairly straightforward to augment the base data model for advanced PCE features.

## 5. The Design of PCEP Data Model

### 5.1. The Overview of PCEP Data Model

The PCEP YANG module defined in this document has all the common building blocks for the PCEP protocol.

```
module: ietf-pcep
    +--rw pcep!
       +--rw entity
          +--rw addr                          inet:ip-address
          +--rw enabled?                      boolean
          +--rw role                          pcep-role
          +--rw description?                  string
          +--rw speaker-entity-id?            string
          |       {stateful-sync-opt}?
          +--rw admin-status?                 pcep-admin-status
          +--ro index?                        uint32
          +--ro oper-status?                  pcep-oper-status
          +--rw domain
          |  +--rw domain* [domain-type domain]
          |        ...
          +--rw capability

          |        ...
          +--rw pce-info
          |  +--rw scope
          |  |     ...
          |  +--rw neigh-domains
          |  |     ...
          |  +--rw path-key {path-key}?
          |        ...

          +--ro lsp-db {stateful}?
          |  +--ro db-ver?             uint64
          |  |       {stateful-sync-opt}?
          |  +--ro association-list*
          |  |       [id source global-source extended-id]
          |  |     ...
          |  +--ro lsp* [plsp-id pcc-id]
          |        ...
          +--ro path-keys {path-key}?
          |  +--ro path-keys* [path-key]
          |        ...
          +--rw peers
             +--rw peer* [addr]

                +--ro sessions
```

```
                    +--ro session* [initiator]
                       ...

     rpcs:
       +---x trigger-resync {stateful,stateful-sync-opt}?
          +---w input
             +---w pcc?   -> /pcep/entity/peers/peer/addr

     notifications:
       +---n pcep-session-up
       |  ...
       +---n pcep-session-down
       |  ...
       +---n pcep-session-local-overload
       |  ...
       +---n pcep-session-local-overload-clear
       |  ...
       +---n pcep-session-peer-overload
       |  ...
       +---n pcep-session-peer-overload-clear
          ...
```

## 5.2. The Full PCEP Data Model

The module, "ietf-pcep", defines the basic components of a PCE speaker.

```
module: ietf-pcep
+--rw pcep!
   +--rw entity
      +--rw addr                          inet:ip-address
      +--rw enabled?                      boolean
      +--rw role                          pcep-role
      +--rw description?                  string
      +--rw speaker-entity-id?            string
      |       {stateful-sync-opt}?
      +--rw admin-status?                 pcep-admin-status
      +--ro index?                        uint32
      +--ro oper-status?                  pcep-oper-status
      +--rw domain
      |  +--rw domain* [domain-type domain]
      |     +--rw domain-type    domain-type
      |     +--rw domain         domain
      +--rw capability
      |  +--rw gmpls?                boolean {gmpls}?
      |  +--rw bi-dir?               boolean
      |  +--rw diverse?              boolean
      |  +--rw load-balance?         boolean
```

```
|  +--rw synchronize?           boolean {svec}?
|  +--rw objective-function?    boolean
|  |       {objective-function}?

## 5.3. The Entity

The PCEP yang module may contain status information for the local PCEP entity.

The entity has an IP address (using ietf-inet-types [RFC6991]) and a "role" leaf (the local entity PCEP role) as mandatory.

Note that, the PCEP MIB module [RFC7420] uses an entity list and a system generated entity index as a primary index to the read only entity table. If the device implements the PCEP MIB, the "index" leaf MUST contain the value of the corresponding pcePcepEntityIndex and only one entity is assumed.

## 5.4. The Peer Lists

The peer list contains peer(s) that the local PCEP entity knows about. A PCEP speaker is identified by its IP address. If there is a PCEP speaker in the network that uses multiple IP addresses then it looks like multiple distinct peers to the other PCEP speakers in the network.

Since PCEP sessions can be ephemeral, the peer list tracks a peer even when no PCEP session currently exists to that peer. The statistics contained are an aggregate of the statistics for all successive sessions to that peer.

To limit the quantity of information that is stored, an implementation MAY choose to discard this information if and only if no PCEP session exists to the corresponding peer.

The data model for PCEP peer presented in this document uses a flat list of peers. Each peer in the list is identified by its IP address (addr-type, addr).

There is a list for static peer configuration and operational state of all peers (i.e.static as well as discovered)("/pcep/entity/peers"). The list is used to enable remote PCE configuration at PCC (or PCE) and has the operational state of these peers as well as the remote PCE peer which were discovered and PCC peers that have initiated session.

### 5.5. The Session Lists

The session list contains PCEP session that the PCEP entity (PCE or PCC) is currently participating in. The statistics in session are semantically different from those in peer since the former applies to the current session only, whereas the latter is the aggregate for all sessions that have existed to that peer.

Although [RFC5440] forbids more than one active PCEP session between a given pair of PCEP entities at any given time, there is a window during session establishment where two sessions may exist for a given pair, one representing a session initiated by the local PCEP entity and the other representing a session initiated by the peer. If either of these sessions reaches active state first, then the other is discarded.

The data model for PCEP session presented in this document uses a flat list of sessions. Each session in the list is identified by its initiator. This index allows two sessions to exist transiently for a given peer, as discussed above.

### 5.6. Notifications

This YANG model defines a list of notifications to inform client of important events detected during the protocol operation. The notifications defined cover the PCEP MIB notifications.

### 5.7. RPC

This YANG model defines a RPC to trigger state resynchronization to a particular PCEP peer.

## 6. The Design of PCEP Statistics Data Model

The module, "ietf-pcep-stats", augments the ietf-pcep module to include statistics at the PCEP peer and session level.

## 7. Advanced PCE Features

This document contains a specification of the base PCEP YANG module, "ietf-pcep" which provides the basic PCEP [RFC5440] data model.

This document further handles advanced PCE features like -

- Capability and Scope
- Domain information (local/neighbour)
- Path-Key
- OF
- GCO
- P2MP
- GMPLS
- Inter-Layer
- Stateful PCE
- Segement Routing
- Authentication including PCEPS (TLS)

### 7.1. Stateful PCE's LSP-DB

In the operational state of PCEP which supports stateful PCE mode, the list of LSP state are maintained in LSP-DB. The key is the PLSP-ID and the PCC IP address.

The PCEP data model contains the operational state of LSPs (/pcep/entity/lsp-db/lsp/) with PCEP specific attributes. The generic TE attributes of the LSP are defined in [I-D.ietf-teas-yang-te]. A reference to LSP state in TE model is maintained.

## 8. Open Issues and Next Step

This section is added so that open issues can be tracked. This section would be removed when the document is ready for publication.

### 8.1. The PCE-Initiated LSP

The TE Model at [I-D.ietf-teas-yang-te] should support creating of tunnels at the controller (PCE) and marking them as PCE-Initiated. The LSP-DB in the PCEP Yang (/pcep/entity/lsp-db/lsp/initiation) also marks the LSPs which are PCE-initiated.

## 9. Other Considerations

### 9.1. PCEP over TLS (PCEPS)

[RFC8253] describe the use of TLS in PCEP. The peer acting as the PCEP client MUST act as the TLS client. The TLS client actively opens the TLS connection and the TLS server passively listens for the incoming TLS connections. The well-known TCP port number 4189 is used by PCEP servers to listen for TCP connections established by PCEP over TLS clients. The TLS client MUST send the TLS ClientHello message to begin the TLS handshake. The TLS server MUST send a CertificateRequest in order to request a certificate from the TLS client. Once the TLS handshake has finished, the client and the server MAY begin to exchange PCEP messages. Client and server identity verification is done before the PCEP open message is sent. This means that the identity verification is completed before the PCEP session is started..

## 10. PCEP YANG Modules

### 10.1. ietf-pcep module

RFC Ed.: In this section, replace all occurrences of 'XXXX' with the actual RFC number and all occurrences of the revision date below with the date of RFC publication (and remove this note).

```
<CODE BEGINS> file "ietf-pcep@2018-06-22.yang"

## 11. Security Considerations

The YANG module defined in this document is designed to be accessed via network management protocol such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer and the mandatory-to-implement secure transport is SSH [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC5246]

The NETCONF access control model [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a pre-configured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in the YANG module which are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., <edit-config>) to these data nodes without proper protection can have a negative

effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

/pcep/entity/ - configure local parameters, capabilities etc.

/pcep/entity/peers - configure remote peers to setup PCEP session.

Unauthorized access to above list can adversely affect the PCEP session between the local entity and the peers. This may lead to inability to compute new paths, stateful operations on the delegated as well as PCE-initiated LSPs.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

/pcep/lsp-db - All the LSPs in the network. Unauthorized access to this could provide the all path and network usage information.

/pcep/path-keys/ - The Confidential Path Segments (CPS) are hidden using path-keys. Unauthorized access to this could leak confidential path information.

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

trigger-resync - trigger resynchronization with the PCE. Unauthorized access to this could force a PCEP session into continuous state synchronization.

## 12. IANA Considerations

This document registers a URI in the "IETF XML Registry" [RFC3688]. Following the format in RFC 3688, the following registration has been made.

URI: urn:ietf:params:xml:ns:yang:ietf-pcep

Registrant Contact: The PCE WG of the IETF.

XML: N/A; the requested URI is an XML namespace.

This document registers a YANG module in the "YANG Module Names" registry [RFC6020].

```
Name:         ietf-pcep
Namespace:    urn:ietf:params:xml:ns:yang:ietf-pcep
Prefix:       pcep
Reference:    This I-D
```

## 13. Acknowledgements

The initial document is based on the PCEP MIB [RFC7420]. We would like to thank the authors of aforementioned documents.
