**A YANG data model for Internet Group Management Protocol (IGMP) and
Multicast Listener Discovery (MLD)**
draft-ietf-pim-igmp-mld-yang-05

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at
<http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at
<http://www.ietf.org/shadow.html>

This Internet-Draft will expire on March 20, 2017.

Abstract

This document defines a YANG data model that can be used to configure and manage Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) devices.

7.1. Normative References	31
7.2. Informative References	32
8. Acknowledgments	32

[1. Introduction](#)

YANG [[RFC6020](#)] [[RFC7950](#)] is a data definition language that was introduced to model the configuration and running state of a device managed using NETCONF [[RFC6241](#)]. YANG is now also being used as a component of wider management interfaces, such as CLIs.

This document defines a YANG data model that can be used to configure and manage Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) devices. This model will support the core IGMP and MLD protocols, as well as many other features mentioned in separate IGMP and MLD RFCs. Non-core features are defined as optional in the provided data model.

Liu & Guo, etc

Expires March 19, 2018

[Page 2]

1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC-2119](#) [[RFC2119](#)].

1.2. Terminology

The terminology for describing YANG data models is found in [[RFC6020](#)] [[RFC7950](#)].

This document employs YANG tree diagrams, which are explained in [I-D.ietf-netmod-rfc6087bis].

2. Design of Data model

2.1. Scope of model

The model covers IGMPv1 [[RFC1112](#)], IGMPv2 [[RFC2236](#)], IGMPv3 [[RFC3376](#)] and MLDv1 [[RFC2710](#)], MLDv2 [[RFC3810](#)].

The configuration of IGMP and MLD features, and the operational state fields and RPC definitions are not all included in this document of the data model. This model can be extended, though the structure of what has been written may be taken as representative of the structure of the whole model.

This model does not cover other IGMP and MLD related protocols such as IGMP/MLD Proxy [[RFC4605](#)] or IGMP/MLD Snooping [[RFC4541](#)] etc., these will be specified in separate documents.

2.2. Optional capabilities

This model is designed to represent the capabilities of IGMP and MLD devices with various specifications, including some with basic subsets of the IGMP and MLD protocols. The main design goals of this document are that any major now-existing implementation may be said to support the basic model, and that the configuration of all implementations meeting the specification is easy to express through some combination of the features in the basic model and simple vendor augmentations.

There is also value in widely-supported features being standardized, to save work for individual vendors, and so that mapping between different vendors' configuration is not needlessly complicated. Therefore these modules declare a number of features representing capabilities that not all deployed devices support.

Liu & Guo, etc

Expires March 19, 2018

[Page 3]

The extensive use of feature declarations should also substantially simplify the capability negotiation process for a vendor's IGMP and MLD implementations.

On the other hand, operational state parameters are not so widely designated as features, as there are many cases where the defaulting of an operational state parameter would not cause any harm to the system, and it is much more likely that an implementation without native support for a piece of operational state would be able to derive a suitable value for a state variable that is not natively supported.

For the same reason, wide constant ranges (for example, timer maximum and minimum) will be used in the model. It is expected that vendors will augment the model with any specific restrictions that might be required. Vendors may also extend the features list with proprietary extensions.

2.3. Position of address family in hierarchy

The current document contains IGMP and MLD as separate schema branches in the structure. The reason for this is to make it easier for implementations which may optionally choose to support specific address families. And the names of objects may be different between the IPv4 (IGMP) and IPv6 (MLD) address families.

3. Module Structure

3.1. IGMP Configuration and Operational state

The IGMP YANG model follows the Guidelines for YANG Module Authors (NMDA) [[draft-dsdt-nmda-guidelines-01](#)]. The IGMP module defines the routing-control-plane-protocol-wide configuration and operational state options separately in a three-level hierarchy as listed below:

Global level: IGMP configuration and operational state attributes for the entire routing system.

Interface-global: Only including configuration data nodes now. IGMP configuration attributes are applicable to all the interfaces whose interface-level corresponding attributes are not existing, with same attributes' value for these interfaces.

Interface-level: IGMP configuration and operational state attributes specific to the given interface.

Where fields are not genuinely essential to protocol operation, they are marked as optional. Some fields will be essential but have a default specified, so that they need not be configured explicitly.

Liu & Guo, etc

Expires March 19, 2018

[Page 4]

We define the IGMP model as a protocol-centric model , and the IGMP model augments "/rt:routing/rt:control-plane-protocols/ rt:control-plane-protocol" in [[draft-acee-netmod-rfc8022bis-01](#)] and would allow a single protocol instance per VRF.

```

augment /rt:routing/rt:control-plane-protocols/rt:control-plane-protocol:

```

[3.2. MLD Configuration and Operational State](#)

The MLD YANG model uses the same structure as IGMP YANG model. The MLD module also defines the routing-control-plane-protocol-wide configuration and operational state options separately in a three-level hierarchy.

```

augment /rt:routing/rt:control-plane-protocols/rt:control-plane-protocol:
  +-rw mld
    +-rw global
      | +-rw enable?           boolean {global-admin-enable}?

```

```
| +-rw max-entries?      uint32 {global-max-entries}?
| +-rw max-groups?      uint32 {global-max-groups}?
| +-ro entries-count?   uint32
| +-ro groups-count?    uint32
| +-ro statistics
|   +-ro discontinuity-time?  yang:date-and-time
|   +-ro error
```

```

|   |   +-+ro total?      yang:counter64
|   |   +-+ro query?     yang:counter64
|   |   +-+ro report?    yang:counter64
|   |   +-+ro leave?     yang:counter64
|   |   +-+ro checksum?   yang:counter64
|   |   +-+ro too-short?  yang:counter64
|   +-+ro received
|       |   +-+ro total?      yang:counter64
|       |   +-+ro query?     yang:counter64
|       |   +-+ro report?    yang:counter64
|       |   +-+ro leave?     yang:counter64
|   +-+ro sent
|       |   +-+ro total?      yang:counter64
|       |   +-+ro query?     yang:counter64
|       |   +-+ro report?    yang:counter64
|       |   +-+ro leave?     yang:counter64
+-+rw interfaces
    +-+rw last-member-query-interval?  uint16
    +-+rw max-groups-per-interface?    uint32 {intf-max-groups}?
    +-+rw query-interval?             uint16
    +-+rw query-max-response-time?   uint16
    +-+rw require-router-alert?       boolean {intf-require-router-
alert}?
    +-+rw robustness-variable?       uint8
    +-+rw version?                 uint8
    +-+rw interface* [interface-name]
        +-+rw interface-name          if:interface-ref
        +-+rw enable?                boolean {intf-admin-
enable}?
        +-+rw group-policy?          string
        +-+rw immediate-leave?       empty {intf-immediate-
leave}?
        +-+rw last-member-query-interval?  uint16
        +-+rw max-groups?            uint32 {intf-max-groups}?
        +-+rw max-group-sources?      uint32 {intf-max-group-
sources}?
        +-+rw query-interval?        uint16
        +-+rw query-max-response-time?  uint16
        +-+rw require-router-alert?   boolean {intf-require-
router-alert}?
        +-+rw robustness-variable?   uint8
        +-+rw source-policy?         string {intf-source-
policy}?
        +-+rw verify-source-subnet?   empty {intf-verify-source-
subnet}?
        +-+rw version?               uint8
        +-+rw join-group*            inet:ipv6-address {intf-
join-group}?

```

```
+--rw ssm-map* [source-addr group-policy] {intf-ssm-map}?
|  +-rw source-addr    ssm-map-ipv6-addr-type
|  +-rw group-policy   string

        +-ro last-reporter inet:ipv6-address

```

[3.3. IGMP and MLD RPC](#)

IGMP and MLD RPC clears the specified IGMP and MLD group membership.

rpcs:

```

+---x clear-igmp-groups {rpc-clear-groups}?
|  +---w input
|  |  +---w interface?   string
|  |  +---w group?       inet:ipv4-address
|  |  +---w source?      inet:ipv4-address
+---x clear-mld-groups {rpc-clear-groups}?
    +---w input
        +---w interface?   string
        +---w group?       inet:ipv6-address
        +---w source?      inet:ipv6-address

```

5. Security Considerations

The data model defined does not introduce any security implications. This document does not change any underlying security issues inherent in [[RFC8022](#)].

6. IANA Considerations

RFC Ed.: In this section, replace all occurrences of 'XXXX' with the actual RFC number (and remove this note).

This document registers the following namespace URIs in the IETF XML registry [[RFC3688](#)]:

URI: urn:ietf:params:xml:ns:yang:ietf-igmp-mld

Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

This document registers the following YANG modules in the YANG Module Names registry [[RFC7950](#)]:

name: ietf-igmp-mld

namespace: urn:ietf:params:xml:ns:yang:ietf-igmp-mld

prefix: igmp-mld
