**A YANG data model for Internet Group Management Protocol (IGMP) and
Multicast Listener Discovery (MLD)**
draft-ietf-pim-igmp-mld-yang-09

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at
<http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at
<http://www.ietf.org/shadow.html>

This Internet-Draft will expire on April 15, 2019.

Abstract

This document defines a YANG data model that can be used to configure and manage Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) devices.

[1. Introduction](#)

YANG [[RFC6020](#)] [[RFC7950](#)] is a data definition language that was introduced to model the configuration and running state of a device managed using network management protocols such as NETCONF [[RFC6241](#)] or RESTCONF [[RFC8040](#)]. YANG is now also being used as a component of wider management interfaces, such as CLIs.

This document defines a YANG data model that can be used to configure and manage Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) devices. This model will support the core IGMP and MLD protocols, as well as many other features

Liu & Guo, etc

Expires April, 2019

[Page 2]

mentioned in separate IGMP and MLD RFCs. Non-core features are defined as optional in the provided data model.

1.1. Terminology

The terminology for describing YANG data models is found in [[RFC6020](#)] [[RFC7950](#)].

The following abbreviations are used in this document and the defined model:

IGMP:

Internet Group Management Protocol [[RFC3376](#)].

MLD:

Multicast Listener Discovery [[RFC3810](#)].

1.2. Tree Diagrams

Tree diagrams used in this document follow the notation defined in [[RFC8340](#)].

1.3. Prefixes in Data Node Names

In this document, names of data nodes, actions, and other data model objects are often used without a prefix, as long as it is clear from the context in which YANG module each name is defined. Otherwise, names are prefixed using the standard prefix associated with the

Prefix	YANG module	Reference
yang	ietf-yang-types	[RFC6991]
inet	ietf-inet-types	[RFC6991]
if	ietf-interfaces	[RFC8343]
ip	ietf-ip	[RFC8344]
rt	ietf-routing	[RFC8349]
rt-types	ietf-routing-types	[RFC8294]

Liu & Guo, etc

Expires April, 2019

Table 1: Prefixes and Corresponding YANG Modules

2. Design of Data model

2.1. Scope of model

The model covers IGMPv1 [[RFC1112](#)], IGMPv2 [[RFC2236](#)], IGMPv3 [[RFC3376](#)] and MLDv1 [[RFC2710](#)], MLDv2 [[RFC3810](#)].

The configuration of IGMP and MLD features, and the operational state fields and RPC definitions are not all included in this document of the data model. This model can be extended, though the structure of what has been written may be taken as representative of the structure of the whole model.

This model does not cover other IGMP and MLD related protocols such as IGMP/MLD Proxy [[RFC4605](#)] or IGMP/MLD Snooping [[RFC4541](#)] etc., these will be specified in separate documents.

2.2. Optional capabilities

This model is designed to represent the capabilities of IGMP and MLD devices with various specifications, including some with basic subsets of the IGMP and MLD protocols. The main design goals of this document are that any major now-existing implementation may be said to support the basic model, and that the configuration of all implementations meeting the specification is easy to express through some combination of the features in the basic model and simple vendor augmentations.

There is also value in widely-supported features being standardized, to save work for individual vendors, and so that mapping between different vendors' configuration is not needlessly complicated. Therefore these modules declare a number of features representing capabilities that not all deployed devices support.

The extensive use of feature declarations should also substantially simplify the capability negotiation process for a vendor's IGMP and MLD implementations.

On the other hand, operational state parameters are not so widely designated as features, as there are many cases where the defaulting of an operational state parameter would not cause any harm to the

Liu & Guo, etc

Expires April, 2019

[Page 4]

system, and it is much more likely that an implementation without native support for a piece of operational state would be able to derive a suitable value for a state variable that is not natively supported.

2.3. Position of address family in hierarchy

The current document contains IGMP and MLD as separate schema branches in the structure. The reason for this is to make it easier for implementations which may optionally choose to support specific address families. And the names of objects may be different between the IPv4 (IGMP) and IPv6 (MLD) address families.

3. Module Structure

3.1. IGMP Configuration and Operational state

The IGMP YANG model conforms to the Network Management Datastore Architecture (NMDA) [[RFC8342](#)]. The operational state data is combined with the associated configuration data in the same hierarchy [[I-D.ietf-netmod-rfc6087bis](#)]. The IGMP module defines in a three-level hierarchy structure as listed below:

Global level: IGMP configuration and operational state attributes for the entire routing system.

Interface-global: Only including configuration data nodes that IGMP configuration attributes are applicable to all the interfaces whose interface-level corresponding attributes are not existing, with same attributes' value for these interfaces.

Interface-level: IGMP configuration and operational state attributes specific to the given interface.

Where fields are not genuinely essential to protocol operation, they are marked as optional. Some fields will be essential but have a default specified, so that they need not be configured explicitly.

This model augments the core routing data model "ietf-routing" specified in [[RFC8349](#)]. The IGMP model augments "/rt:routing/rt:control-plane-protocols" as opposed to augmenting "/rt:routing/rt:control-plane-protocols/rt:control-plane-protocol", as the latter would allow multiple protocol instances, while the IGMP protocol is designed to be enabled or disabled as a single protocol instance on a network instance or a logical network element.

```

[3.2. MLD Configuration and Operational State](#)

The MLD YANG model uses the same structure as IGMP YANG model. The MLD module also defines in a three-level hierarchy structure as listed below:

```

augment /rt:routing/rt:control-plane-protocols:
  +-rw mld {feature-mld}?
    +-rw global
    |  +-rw enable?           boolean {global-admin-enable}?
    |  +-rw max-entries?      uint32 {global-max-entries}?
    |  +-rw max-groups?       uint32 {global-max-groups}?
    |  +-ro entries-count?    uint32
    |  +-ro groups-count?     uint32
    |  +-ro statistics
    |    +-ro discontinuity-time? yang:date-and-time
    |    +-ro error

```

```
|   |   +-ro total?      yang:counter64
|   |   +-ro query?      yang:counter64
|   |   +-ro report?     yang:counter64
|   |   +-ro leave?      yang:counter64
|   |   +-ro checksum?    yang:counter64
```

```

|   |   +-+ro too-short?    yang:counter64
|   +-+ro received
|   |   +-+ro total?      yang:counter64
|   |   +-+ro query?      yang:counter64
|   |   +-+ro report?     yang:counter64
|   |   +-+ro leave?      yang:counter64
|   +-+ro sent
|       +-+ro total?      yang:counter64
|       +-+ro query?      yang:counter64
|       +-+ro report?     yang:counter64
|       +-+ro leave?      yang:counter64
+-+rw interfaces
    +-+rw last-member-query-interval?  uint16
    +-+rw query-interval?            uint16
    +-+rw query-max-response-time?  uint16
    +-+rw require-router-alert?     boolean {intf-require-router-
alert}?
    +-+rw robustness-variable?      uint8
    +-+rw version?                uint8
    +-+rw max-groups-per-interface? uint32 {intf-max-groups}?
    +-+rw interface* [interface-name]
        +-+rw interface-name          if:interface-ref

5. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [[RFC6241](#)] or RESTCONF [[RFC8040](#)]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [[RFC6242](#)]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [[RFC5246](#)].

The NETCONF access control model [[RFC6536](#)] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

`igmp:global`

This subtree specifies the configuration for the IGMP attributes at the global level on a device. Modifying the configuration can cause IGMP membership deleted or reconstructed on all the interfaces of a device.

`igmp:interfaces`

This subtree specifies the configuration for the IGMP attributes at all of the interfaces level on a device. Modifying the configuration can cause IGMP membership deleted or reconstructed on all the interfaces of a device.

`igmp:interfaces/interface`

This subtree specifies the configuration for the IGMP attributes at the interface level on a device. Modifying the configuration can cause IGMP membership deleted or reconstructed on a specific interface of a device.

These subtrees are all under

`/rt:routing/rt:control-plane protocols/igmp:`

`mld:global`

Liu & Guo, etc

Expires April, 2019

[Page 33]

This subtree specifies the configuration for the MLD attributes at the global level on a device. Modifying the configuration can cause MLD membership deleted or reconstructed on all the interfaces of a device.

mld:interfaces

This subtree specifies the configuration for the MLD attributes at all of the interfaces level on a device. Modifying the configuration can cause MLD membership deleted or reconstructed on all the interfaces of a device.

mld:interfaces/interface

This subtree specifies the configuration for the MLD attributes at the interface level on a device. Modifying the configuration can cause MLD membership deleted or reconstructed on a specific interface of a device.

These subtrees are all under

/rt:routing/rt:control-plane-protocols/mld:

Unauthorized access to any data node of these subtrees can adversely affect the membership records of multicast routing subsystem on the local device. This may lead to network malfunctions, delivery of packets to inappropriate destinations, and other problems.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

/rt:routing/rt:control-plane-protocols/igmp

/rt:routing/rt:control-plane-protocols/mld

Unauthorized access to any data node of the above subtree can disclose the operational state information of IGMP or MLD on this device.

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

clear-igmp-groups

Liu & Guo, etc

Expires April, 2019

[Page 34]

clear-mld-groups

Unauthorized access to any of the above RPC operations can delete the IGMP or MLD membership records on this device.

6. IANA Considerations

RFC Ed.: In this section, replace all occurrences of 'XXXX' with the actual RFC number (and remove this note).

This document registers the following namespace URIs in the IETF XML registry [[RFC3688](#)]:

URI: urn:ietf:params:xml:ns:yang:ietf-igmp-mld

Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

This document registers the following YANG modules in the YANG Module Names registry [[RFC7950](#)]:

name: ietf-igmp-mld

namespace: urn:ietf:params:xml:ns:yang:ietf-igmp-mld

prefix: igmp-mld

reference: RFC XXXX

7. Acknowledgments

The authors would like to thank Steve Baillargeon, Hu Fangwei, Robert Kebler, Tanmoy Kundu, and Stig Venaas for their valuable contributions.
