HTTP/3 and QPACK qlog event definitions  
draft-ietf-quic-qlog-h3-events-01

## Abstract

This document describes concrete qlog event definitions and their metadata for HTTP/3 and QPACK-related events. These events can then be embedded in the higher level schema defined in [[QLOG-MAIN](#)].

## Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 8 September 2022.

## [1.](#) Introduction

This document describes the values of the qlog name ("category" + "event") and "data" fields and their semantics for the HTTP/3 and QPACK protocols. This document is based on [draft-34](#) of the HTTP/3 I-D [[QUIC-HTTP](#)] and [draft-21](#) of the QPACK I-D [[QUIC-QPACK](#)]. QUIC events are defined in a separate document [[QLOG-QUIC](#)].

Feedback and discussion are welcome at <https://github.com/quicwg/qlog> (<https://github.com/quicwg/qlog>). Readers are advised to refer to the "editor's draft" at that URL for an up-to-date version of this document.

Concrete examples of integrations of this schema in various programming languages can be found at <https://github.com/quiclog/qlog/> (<https://github.com/quiclog/qlog/>).

## [1.1.](#) Notational Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

The event and data structure definitions in this document are expressed in the Concise Data Definition Language [[CDDL](#)] and its extensions described in [[QLOG-MAIN](#)].

## [2.](#) Overview

This document describes the values of the qlog "name" ("category" + "event") and "data" fields and their semantics for the HTTP/3 and QPACK protocols.

This document assumes the usage of the encompassing main qlog schema defined in [[QLOG-MAIN](#)]. Each subsection below defines a separate category (for example http, qpack) and each subsubsection is an event type (for example frame\_created).

For each event type, its importance and data definition is laid out, often accompanied by possible values for the optional "trigger" field. For the definition and semantics of "importance" and "trigger", see the mainschema document.

Most of the complex datastructures, enums and re-usable definitions are grouped together on the bottom of this document for clarity.

### [2.1.](#) Usage with QUIC

The events described in this document can be used with or without logging the related QUIC events defined in [[QLOG-QUIC](#)]. If used with QUIC events, the QUIC document takes precedence in terms of recommended filenames and trace separation setups.

If used without QUIC events, it is recommended that the implementation assign a globally unique identifier to each HTTP/3 connection. This ID can then be used as the value of the qlog

"group\_id" field, as well as the qlog filename or file identifier, potentially suffixed by the vantagepoint type (For example, abcd1234\_server.qlog would contain the server-side trace of the connection with GUID abcd1234).

## [2.2.](#) Links to the main schema

This document re-uses all the fields defined in the main qlog schema (e.g., name, category, type, data, group\_id, protocol\_type, the time-related fields, importance, RawInfo, etc.).

One entry in the "protocol\_type" qlog array field MUST be "HTTP3" if events from this document are included in a qlog trace.

### [2.2.1.](#) Raw packet and frame information

This document re-uses the definition of the RawInfo data class from [\[QLOG-MAIN\]](#).

Note: As HTTP/3 does not use trailers in frames, each HTTP/3 frame header\_length can be calculated as header\_length = RawInfo:length - RawInfo:payload\_length

Note: In some cases, the length fields are also explicitly reflected inside of frame headers. For example, all HTTP/3 frames include their explicit payload lengths in the frame header. In these cases, those fields are intentionally preserved in the event definitions. Even though this can lead to duplicate data when the full RawInfo is logged, it allows a more direct mapping of the HTTP/3 specifications to qlog, making it easier for users to interpret. In this case, both fields MUST have the same value.

## [3.](#) HTTP/3 and QPACK event definitions

Each subheading in this section is a qlog event category, while each sub-subheading is a qlog event type.

For example, for the following two items, we have the category "http" and event type "parameters\_set", resulting in a concatenated qlog "name" field value of "http:parameters\_set".

### [3.1.](#) http

Note: like all category values, the "http" category is written in lowercase.

#### [3.1.1.](#) parameters\_set

Importance: Base

This event contains HTTP/3 and QPACK-level settings, mostly those received from the HTTP/3 SETTINGS frame. All these parameters are typically set once and never change. However, they are typically set at different times during the connection, so there can be several instances of this event with different fields set.

Note that some settings have two variations (one set locally, one requested by the remote peer). This is reflected in the "owner" field. As such, this field **MUST** be correct for all settings included a single event instance. If you need to log settings from two sides, you **MUST** emit two separate event instances.

Note: we use the CDDL unwrap operator (~) here to make HTTPParameters into a re-usable list of fields. The unwrap operator copies the fields from the referenced type into the target type directly, extending the target with the unwrapped fields. TODO: explain this better + provide reference and maybe an example.

Definition:

```
HTTPParametersSet = {  
    ? owner: Owner  
  
    ~HTTPParameters  
  
    ; qlog-specific  
    ; indicates whether this implementation waits for a SETTINGS  
    ; frame before processing requests  
    ? waits_for_settings: bool  
}  
  
HTTPParameters = {  
    ? max_header_list_size: uint64
```

```

? max_table_capacity: uint64
? blocked_streams_count: uint64

; additional settings for grease and extensions
* text => uint64
}

```

Figure 1: HTTPParametersSet definition

Note: enabling server push is not explicitly done in HTTP/3 by use of a setting or parameter. Instead, it is communicated by use of the MAX\_PUSH\_ID frame, which should be logged using the frame\_created and frame\_parsed events below.

Additionally, this event can contain any number of unspecified fields. This is to reflect setting of for example unknown (greased) settings or parameters of (proprietary) extensions.

### [3.1.2.](#) parameters\_restored

Importance: Base

When using QUIC 0-RTT, HTTP/3 clients are expected to remember and reuse the server's SETTINGS from the previous connection. This event is used to indicate which HTTP/3 settings were restored and to which values when utilizing 0-RTT.

Definition:

```

HTTPParametersRestored = {
    ~HTTPParameters
}

```

Figure 2: HTTPParametersRestored definition

Note that, like for `parameters_set` above, this event can contain any number of unspecified fields to allow for additional and custom settings.

### [3.1.3.](#) `stream_type_set`

Importance: Base

Emitted when a stream's type becomes known. This is typically when a stream is opened and the stream's type indicator is sent or received.

Note: most of this information can also be inferred by looking at a stream's id, since id's are strictly partitioned at the QUIC level. Even so, this event has a "Base" importance because it helps a lot in debugging to have this information clearly spelled out.

Definition:

```
HTTPStreamTypeSet = {  
    ? owner: Owner  
    stream_id: uint64  
  
    ? old: HTTPStreamType  
    new: HTTPStreamType  
  
    ; only when new == "push"  
    ? associated_push_id: uint64  
}  
  
HTTPStreamType = "data" /  
                 "control" /  
                 "push" /  
                 "reserved" /  
                 "qpack_encode" /  
                 "qpack_decode"
```

Figure 3: `HTTPStreamTypeSet` definition

### [3.1.4.](#) `frame_created`

Importance: Core

HTTP equivalent to the `packet_sent` event. This event is emitted when the HTTP/3 framing actually happens. Note: this is not necessarily the same as when the HTTP/3 data is passed on to the QUIC layer. For that, see the "data\_moved" event in [[QLOG-QUIC](#)].

Definition:

```
HTTPFrameCreated = {  
    stream_id: uint64  
    ? length: uint64  
    frame: HTTPFrame  
    ? raw: RawInfo  
}
```

Figure 4: HTTPFrameCreated definition

Note: in HTTP/3, DATA frames can have arbitrarily large lengths to reduce frame header overhead. As such, DATA frames can span many QUIC packets and can be created in a streaming fashion. In this case, the `frame_created` event is emitted once for the frame header, and further streamed data is indicated using the `data_moved` event.

#### [3.1.5.](#) frame\_parsed

Importance: Core

HTTP equivalent to the `packet_received` event. This event is emitted when we actually parse the HTTP/3 frame. Note: this is not necessarily the same as when the HTTP/3 data is actually received on the QUIC layer. For that, see the "data\_moved" event in [[QLOG-QUIC](#)].

Definition:

```
HTTPFrameParsed = {  
    stream_id: uint64  
    ? length: uint64  
    frame: HTTPFrame  
    ? raw: RawInfo  
}
```

Figure 5: HTTPFrameParsed definition

Note: in HTTP/3, DATA frames can have arbitrarily large lengths to reduce frame header overhead. As such, DATA frames can span many QUIC packets and can be processed in a streaming fashion. In this case, the `frame_parsed` event is emitted once for the frame header, and further streamed data is indicated using the `data_moved` event.

#### [3.1.6.](#) `push_resolved`

Importance: Extra

This event is emitted when a pushed resource is successfully claimed (used) or, conversely, abandoned (rejected) by the application on top of HTTP/3 (e.g., the web browser). This event is added to help debug problems with unexpected PUSH behaviour, which is commonplace with HTTP/2.

Definition:

```
HTTTPushResolved = {  
    ? push_id: uint64  
  
    ; in case this is logged from a place that does not have access  
    ; to the push_id  
    ? stream_id: uint64  
  
    decision: HTTTPushDecision  
}  
  
HTTTPushDecision = "claimed" / "abandoned"
```

Figure 6: HTTTPushResolved definition

#### [3.2.](#) `qpack`

Note: like all category values, the "qpack" category is written in lowercase.

The QPACK events mainly serve as an aid to debug low-level QPACK issues. The higher-level, plaintext header values SHOULD (also) be logged in the `http.frame_created` and `http.frame_parsed` event data (instead).

Note: qpack does not have its own `parameters_set` event. This was merged with `http.parameters_set` for brevity, since qpack is a required extension for HTTP/3 anyway. Other HTTP/3 extensions MAY also log their SETTINGS fields in `http.parameters_set` or MAY define

their own events.

### [3.2.1.](#) state\_updated

Importance: Base

This event is emitted when one or more of the internal QPACK variables changes value. Note that some variables have two variations (one set locally, one requested by the remote peer). This is reflected in the "owner" field. As such, this field **MUST** be correct for all variables included a single event instance. If you need to log settings from two sides, you **MUST** emit two separate event instances.

Definition:

```
QPACKStateUpdate = {  
  owner: Owner  
  ? dynamic_table_capacity: uint64  
  
  ; effective current size, sum of all the entries  
  ? dynamic_table_size: uint64  
  ? known_received_count: uint64  
  ? current_insert_count: uint64  
}
```

Figure 7: QPACKStateUpdate definition

### [3.2.2.](#) stream\_state\_updated

Importance: Core

This event is emitted when a stream becomes blocked or unblocked by header decoding requests or QPACK instructions.

Note: This event is of "Core" importance, as it might have a large impact on HTTP/3's observed performance.

Definition:

```
QPACKStreamStateUpdate = {
```

```

    stream_id: uint64
    ; streams are assumed to start "unblocked"
    ; until they become "blocked"
    state: QPACKStreamState
}

```

QPACKStreamState = "blocked" / "unblocked"

Figure 8: QPACKStreamStateUpdate definition

### [3.2.3.](#) dynamic\_table\_updated

Importance: Extra

This event is emitted when one or more entries are inserted or evicted from QPACK's dynamic table.

Definition:

```

QPACKDynamicTableUpdate = {
    ; local = the encoder's dynamic table
    ; remote = the decoder's dynamic table
    owner: Owner

    update_type: QPACKDynamicTableUpdateType
    entries: [+ QPACKDynamicTableEntry]
}

```

QPACKDynamicTableUpdateType = "inserted" / "evicted"

```

QPACKDynamicTableEntry = {
    index: uint64
    ? name: text / hexstring
    ? value: text / hexstring
}

```

Figure 9: QPACKDynamicTableUpdate definition

### [3.2.4.](#) headers\_encoded

Importance: Base

This event is emitted when an uncompressed header block is encoded successfully.

Note: this event has overlap with `http.frame_created` for the `HeadersFrame` type. When outputting both events, implementers MAY omit the "headers" field in this event.

Definition:

```
QPACKHeadersEncoded = {  
  ? stream_id: uint64  
  ? headers: [+ HTTPField]  
  
  block_prefix: QPACKHeaderBlockPrefix  
  header_block: [+ QPACKHeaderBlockRepresentation]  
  
  ? length: uint  
  ? raw: hexstring  
}
```

Figure 10: QPACKHeadersEncoded definition

#### [3.2.5.](#) headers\_decoded

Importance: Base

This event is emitted when a compressed header block is decoded successfully.

Note: this event has overlap with `http.frame_parsed` for the `HeadersFrame` type. When outputting both events, implementers MAY omit the "headers" field in this event.

Definition:

```

QPACKHeadersDecoded = {
    ? stream_id: uint64
    ? headers: [+ HTTPField]

    block_prefix: QPACKHeaderBlockPrefix
    header_block: [+ QPACKHeaderBlockRepresentation]

    ? length: uint32
    ? raw: hexstring
}

```

Figure 11: QPACKHeadersDecoded definition

### [3.2.6.](#) instruction\_created

Importance: Base

This event is emitted when a QPACK instruction (both decoder and encoder) is created and added to the encoder/decoder stream.

Definition:

```

QPACKInstructionCreated = {
    ; see definition in appendix
    instruction: QPACKInstruction
    ? length: uint32
    ? raw: hexstring
}

```

Figure 12: QPACKInstructionCreated definition

Note: encoder/decoder semantics and stream\_id's are implicit in either the instruction types or can be logged via other events (e.g., http.stream\_type\_set)

### [3.2.7.](#) instruction\_parsed

Importance: Base

This event is emitted when a QPACK instruction (both decoder and

encoder) is read from the encoder/decoder stream.

Definition:

```
QPACKInstructionParsed = {  
    ; see QPACKInstruction definition in appendix  
    instruction: QPACKInstruction  
  
    ? length: uint32  
    ? raw: hexstring  
}
```

Figure 13: QPACKInstructionParsed definition

Note: encoder/decoder semantics and stream\_id's are implicit in either the instruction types or can be logged via other events (e.g., http.stream\_type\_set)

    ? raw: hexstring  
}
```

Figure 17: HTTPDataFrame definition

##### [A.3.2.](#) HeadersFrame

This represents an `_uncompressed_`, plaintext HTTP Headers frame (e.g., no QPACK compression is applied).

For example:

```
headers: [  
  {  
    "name": ":path",  
    "value": "/"  
  },  
  {  
    "name": ":method",  
    "value": "GET"  
  },  
  {  
    "name": ":authority",  
    "value": "127.0.0.1:4433"  
  },  
  {  
    "name": ":scheme",  
    "value": "https"  
  }  
]
```

Figure 18: HTTPHeadersFrame example

```
HTTPHeadersFrame = {  
  frame_type: "headers"  
  headers: [* HTTPField]  
}
```

Figure 19: HTTPHeadersFrame definition

```
HTTPField = {  
  name: text  
  value: text  
}
```

Figure 20: HTTPField definition

#### [A.3.3.](#) CancelPushFrame

```
HTTPCancelPushFrame = {  
  frame_type: "cancel_push"  
  push_id: uint64  
}
```

Figure 21: HTTPCancelPushFrame definition

#### [A.3.4.](#) SettingsFrame

```
HTTPSettingsFrame = {  
    frame_type: "settings"  
    settings: [* HTTPSetting]  
}  
  
HTTPSetting = {  
    name: text  
    value: uint64  
}
```

Figure 22: HTTPSettingsFrame definition

#### [A.3.5.](#) PushPromiseFrame

```
HTTPPushPromiseFrame = {  
    frame_type: "push_promise"  
    push_id: uint64  
    headers: [* HTTPField]  
}
```

Figure 23: HTTPPushPromiseFrame definition

#### [A.3.6.](#) GoAwayFrame

```
HTTPGoawayFrame = {  
    frame_type: "goaway"  
  
    ; Either stream_id or push_id.  
    ; This is implicit from the sender of the frame  
    id: uint64  
}
```

Figure 24: HTTPGoawayFrame definition

#### [A.3.7.](#) MaxPushIDFrame

```
HTTPMaxPushIDFrame = {  
    frame_type: "max_push_id"  
    push_id: uint64  
}
```

Figure 25: HTTPMaxPushIDFrame definition

#### [A.3.8.](#) ReservedFrame

Marx, et al.

Expires 8 September 2022

[Page 17]

---

Internet-Draft HTTP/3 and QPACK qlog event definitions

March 2022

```
HTTPReservedFrame = {  
    frame_type: "reserved"  
  
    ? length: uint64  
}
```

Figure 26: HTTPReservedFrame definition

#### [A.3.9.](#) UnknownFrame

HTTP/3 qlog re-uses QUIC's UnknownFrame definition, since their values and usage overlaps. See [[QLOG-QUIC](#)].

#### [A.4.](#) ApplicationError

```
HTTPApplicationError = "http_no_error" /  
                        "http_general_protocol_error" /  
                        "http_internal_error" /  
                        "http_stream_creation_error" /  
                        "http_closed_critical_stream" /  
                        "http_frame_unexpected" /  
                        "http_frame_error" /  
                        "http_excessive_load" /  
                        "http_id_error" /  
                        "http_settings_error" /  
                        "http_missing_settings" /  
                        "http_request_rejected" /  
                        "http_request_cancelled" /  
                        "http_request_incomplete" /  
                        "http_early_response" /  
                        "http_connect_error" /  
                        "http_version_fallback"
```

Figure 27: HTTPApplicationError definition

The HTTPApplicationError defines the general \$ApplicationError definition in the qlog QUIC definition, see [[QLOG-QUIC](#)].

```
; ensure HTTP errors are properly validate in QUIC events as well
; e.g., QUIC's ConnectionClose Frame
$ApplicationError /= HTTPApplicationError
```

## [Appendix B](#). QPACK DATA type definitions

### [B.1](#). ProtocolEventBody extension

We extend the \$ProtocolEventBody extension point defined in [[QLOG-MAIN](#)] with the QPACK protocol events defined in this document.

Marx, et al. Expires 8 September 2022 [Page 18]

---

Internet-Draft HTTP/3 and QPACK qlog event definitions March 2022

```
QPACKEvents = QPACKStateUpdate / QPACKStreamStateUpdate /
               QPACKDynamicTableUpdate / QPACKHeadersEncoded /
               QPACKHeadersDecoded / QPACKInstructionCreated /
               QPACKInstructionParsed

$ProtocolEventBody /= QPACKEvents
```

Figure 28: QPACKEvents definition and ProtocolEventBody extension

### [B.2](#). QPACK Instructions

Note: the instructions do not have explicit encoder/decoder types, since there is no overlap between the instructions of both types in neither name nor function.

```
QPACKInstruction = SetDynamicTableCapacityInstruction /
                   InsertWithNameReferenceInstruction /
                   InsertWithoutNameReferenceInstruction /
                   DuplicateInstruction /
                   SectionAcknowledgementInstruction /
                   StreamCancellationInstruction /
                   InsertCountIncrementInstruction
```

Figure 29: QPACKInstruction definition

#### [B.2.1](#). SetDynamicTableCapacityInstruction

```
SetDynamicTableCapacityInstruction = {
    instruction_type: "set_dynamic_table_capacity"
    capacity: uint32
}
```

Figure 30: SetDynamicTableCapacityInstruction definition

#### [B.2.2.](#) InsertWithNameReferenceInstruction

```
InsertWithNameReferenceInstruction = {
    instruction_type: "insert_with_name_reference"
    table_type: QPACKTableType
    name_index: uint32
    huffman_encoded_value: bool
    ? value_length: uint32
    ? value: text
}
```

Figure 31: InsertWithNameReferenceInstruction definition

#### [B.2.3.](#) InsertWithoutNameReferenceInstruction

```
InsertWithoutNameReferenceInstruction = {
    instruction_type: "insert_without_name_reference"
    huffman_encoded_name: bool
    ? name_length: uint32
    ? name: text
    huffman_encoded_value: bool
    ? value_length: uint32
    ? value: text
}
```

Figure 32: InsertWithoutNameReferenceInstruction definition

#### [B.2.4.](#) DuplicateInstruction

```
DuplicateInstruction = {
    instruction_type: "duplicate"
    index: uint32
}
```

```
}
```

Figure 33: DuplicateInstruction definition

#### [B.2.5.](#) SectionAcknowledgementInstruction

```
SectionAcknowledgementInstruction = {  
    instruction_type: "section_acknowledgement"  
    stream_id: uint64  
}
```

Figure 34: SectionAcknowledgementInstruction definition

#### [B.2.6.](#) StreamCancellationInstruction

```
StreamCancellationInstruction = {  
    instruction_type: "stream_cancellation"  
    stream_id: uint64  
}
```

Figure 35: StreamCancellationInstruction definition

#### [B.2.7.](#) InsertCountIncrementInstruction

```
InsertCountIncrementInstruction = {  
    instruction_type: "insert_count_increment"  
    increment: uint32  
}
```

Figure 36: InsertCountIncrementInstruction definition

### [B.3.](#) QPACK Header compression

```
QPACKHeaderBlockRepresentation = IndexedHeaderField /  
                                LiteralHeaderFieldWithName /  
                                LiteralHeaderFieldWithoutName
```

Figure 37: QPACKHeaderBlockRepresentation definition

#### [B.3.1.](#) IndexedHeaderField

Note: also used for "indexed header field with post-base index"

```
IndexedHeaderField = {
    header_field_type: "indexed_header"

    ; MUST be "dynamic" if is_post_base is true
    table_type: QPACKTableType
    index: uint32

    ; to represent the "indexed header field with post-base index"
    ; header field type
    is_post_base: bool .default false
}
```

Figure 38: IndexedHeaderField definition

### [B.3.2.](#) LiteralHeaderFieldWithName

Note: also used for "Literal header field with post-base name reference"

```
LiteralHeaderFieldWithName = {
    header_field_type: "literal_with_name"

    ; the 3rd "N" bit
    preserve_literal: bool
}
```

```

    ; MUST be "dynamic" if is_post_base is true
    table_type: QPACKTableType
    name_index: uint32
    huffman_encoded_value: bool
    ? value_length: uint32
    ? value: text

    ; to represent the "indexed header field with post-base index"
    ; header field type
    is_post_base: bool .default false
}

```

Figure 39: LiteralHeaderFieldWithName definition

### [B.3.3.](#) LiteralHeaderFieldWithoutName

```

LiteralHeaderFieldWithoutName = {
    header_field_type: "literal_without_name"

    ; the 3rd "N" bit
    preserve_literal: bool
    huffman_encoded_name: bool
    ? name_length: uint32
    ? name: text

    huffman_encoded_value: bool
    ? value_length: uint32
    ? value: text
}

```

Figure 40: LiteralHeaderFieldWithoutName definition

### [B.3.4.](#) QPACKHeaderBlockPrefix

```

QPACKHeaderBlockPrefix = {
    required_insert_count: uint32
    sign_bit: bool
    delta_base: uint32
}

```

Figure 41: QPACKHeaderBlockPrefix definition

### [B.3.5.](#) QPACKTableType

QPACKTableType = "static" / "dynamic"

Figure 42: QPACKTableType definition

## [Appendix C.](#) Change Log

### [C.1.](#) Since [draft-ietf-quic-qlog-h3-events-00](#):

- \* Change the data definition language from TypeScript to CDDL (#143)

### [C.2.](#) Since [draft-marx-qlog-event-definitions-quic-h3-02](#):

- \* These changes were done in preparation of the adoption of the drafts by the QUIC working group (#137)
- \* Split QUIC and HTTP/3 events into two separate documents
- \* Moved RawInfo, Importance, Generic events and Simulation events to the main schema document.

### [C.3.](#) Since [draft-marx-qlog-event-definitions-quic-h3-01](#):

Major changes:

- \* Moved data\_moved from http to transport. Also made the "from" and "to" fields flexible strings instead of an enum (#111,#65)
- \* Moved packet\_type fields to PacketHeader. Moved packet\_size field out of PacketHeader to RawInfo:length (#40)
- \* Made events that need to log packet\_type and packet\_number use a header field instead of logging these fields individually
- \* Added support for logging retry, stateless reset and initial tokens (#94,#86,#117)
- \* Moved separate general event categories into a single category "generic" (#47)
- \* Added "transport:connection\_closed" event (#43,#85,#78,#49)
- \* Added version\_information and alpn\_information events (#85,#75,#28)
- \* Added parameters\_restored events to help clarify 0-RTT behaviour (#88)

Smaller changes:

- \* Merged `loss_timer` events into one `loss_timer_updated` event
- \* Field data types are now strongly defined (#10,#39,#36,#115)
- \* Renamed `qpack_instruction_received` and `instruction_sent` to `instruction_created` and `instruction_parsed` (#114)
- \* Updated `qpack:dynamic_table_updated.update_type`. It now has the value `"inserted"` instead of `"added"` (#113)
- \* Updated `qpack:dynamic_table_updated`. It now has an `"owner"` field to differentiate encoder vs decoder state (#112)
- \* Removed `push_allowed` from `http:parameters_set` (#110)
- \* Removed explicit trigger field indications from events, since this was moved to be a generic property of the `"data"` field (#80)
- \* Updated `transport:connection_id_updated` to be more in line with other similar events. Also dropped importance from Core to Base (#45)
- \* Added length property to `PaddingFrame` (#34)
- \* Added `packet_number` field to `transport:frames_processed` (#74)
- \* Added a way to generically log packet header flags (first 8 bits) to `PacketHeader`
- \* Added additional guidance on which events to log in which situations (#53)
- \* Added `"simulation:scenario"` event to help indicate simulation details
- \* Added `"packets_acked"` event (#107)
- \* Added `"datagram_ids"` to the `datagram_X` and `packet_X` events to allow tracking of coalesced QUIC packets (#91)

- \* Extended connection\_state\_updated with more fine-grained states (#49)

Marx, et al.

Expires 8 September 2022

[Page 24]

---

Internet-Draft HTTP/3 and QPACK qlog event definitions

March 2022

[C.4.](#) Since [draft-marx-qlog-event-definitions-quic-h3-00](#):

- \* Event and category names are now all lowercase
- \* Added many new events and their definitions
- \* "type" fields have been made more specific (especially important for PacketType fields, which are now called packet\_type instead of type)
- \* Events are given an importance indicator (issue #22)
- \* Event names are more consistent and use past tense (issue #21)
- \* Triggers have been redefined as properties of the "data" field and updated for most events (issue #23)

[Appendix D.](#) Design Variations

TBD

[Appendix E.](#) Acknowledgements

Much of the initial work by Robin Marx was done at Hasselt University.

Thanks to Marten Seemann, Jana Iyengar, Brian Trammell, Dmitri Tikhonov, Stephen Petrides, Jari Arkko, Marcus Ihlar, Victor Vasiliev, Mirja Kuehlewind, Jeremy Laine, Kazu Yamamoto, Christian Huitema, and Lucas Pardue for their feedback and suggestions.
