

SDP for the WebRTC
draft-ietf-rtcweb-sdp-02

Abstract

The Web Real-Time Communication [[WebRTC](#)] working group is charged to provide protocol support for direct interactive rich communication using audio, video and data between two peers' web browsers. Within the WebRTC framework, Session Description protocol (SDP) [[RFC4566](#)] is used for negotiating session capabilities between the peers. Such a negotiation happens based on the SDP Offer/Answer exchange mechanism described in [[RFC3264](#)].

This document provides an informational reference in describing the role of SDP and the Offer/Answer exchange mechanism for the most common WebRTC use-cases.

This SDP examples provided in this document is still a work in progress, but it aims to align closest to the evolving standards work.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 8, 2017.

[1. Introduction](#)

Javascript Session Exchange Protocol(JSEP) [[I-D.ietf-rtcweb-jsep](#)] specifies a generic protocol needed to generate [[RFC3264](#)] Offers and Answers negotiated between the WebRTC peers for setting up, updating and tearing down a WebRTC session. For this purpose, SDP is used to construct [[RFC3264](#)] Offers/Answers for describing (media and non-media) streams as appropriate for the recipients of the session description to participate in the session.

The remainder of this document is organized as follows: Sections [3](#) and 4 provides an overview of SDP and the Offer/Answer exchange mechanism. [Section 5](#) provides sample SDP generated for the most common WebRTC use-cases.

[2. Terminology](#)

The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

[3. SDP and the WebRTC](#)

The purpose of this section is to provide a general overview of SDP and its components. For a more in-depth understanding, the readers are advised to refer to [[RFC4566](#)].

The Session Description Protocol (SDP) [[RFC4566](#)] describes multimedia sessions, which can contain audio, video, whiteboard, fax, modem, and other streams. SDP provides a general purpose, standard representation to describe various aspects of multimedia session such as media capabilities, transport addresses and related metadata in a transport agnostic manner, for the purposes of session announcement, session invitation and parameter negotiation.

As of today SDP is widely used in the context of Session Initiation Protocol [[RFC3261](#)], Real-time Transport Protocol [[RFC3550](#)] and Real-time Streaming Protocol applications [[RFC2326](#)].

Below figure introduces high-level breakup of SDP into components that semantically describe a multimedia session, in our case, a

Nandakumar & Jennings

[Page 3]

WebRTC session [[WebRTC](#)]. It by no means captures everything about SDP and hence, should be used for informational purposes only.

Nandakumar & Jennings Expires January 8, 2017

[Page 4]

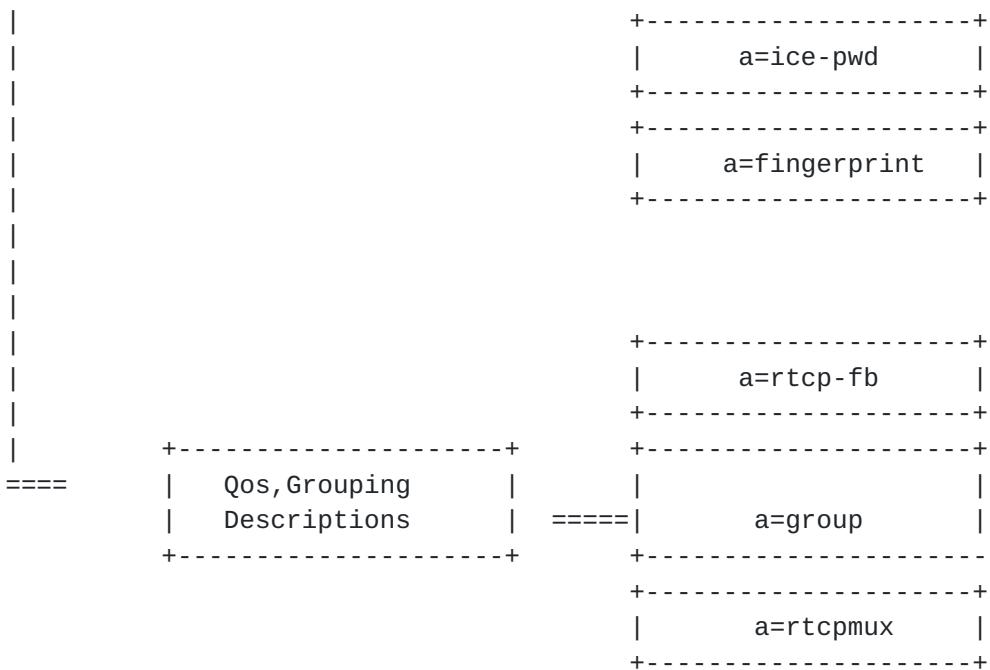

Figure 1: Semantic Components of SDP

[WebRTC] proposes JavaScript application to fully specify and control the signaling plane of a multimedia session as described in the JSEP specification [[I-D.ietf-rtcweb-jsep](#)]. JSEP provides mechanisms to create session characterization and media definition information to conduct the session based on SDP exchanges.

In this context, SDP serves two purposes:

1. Provide grammatical structure syntactically.
 2. Semantically convey participant's intention and capabilities required to successfully negotiate a session.

4. Offer/Answer and the WebRTC

This section introduces SDP Offer/Answer Exchange mechanism mandated by WebRTC for negotiating session capabilities while setting up, updating and tearing down a WebRTC session. This section is intentionally brief in nature and interested readers are recommended to refer [[RFC3264](#)] for specific details on the protocol operation.

Nandakumar & Jennings

Expires January 8, 2017

[Page 5]

The Offer/Answer [[RFC3264](#)] model specifies rule for the bilateral exchange of Session Description Protocol (SDP) messages for creation of multimedia streams. It defines protocol with involved participants exchanging desired session characteristics from each others perspective constructed as SDP to negotiate the session between them.

In the most basic form, the protocol operation begins by one of the participants sending an initial SDP Offer describing its intent to start a multimedia communication session. The participant receiving the offer MAY generate an SDP Answer accepting the offer or it MAY reject the offer. If the session is accepted the Offer/Answer model guarantees a common view of the multimedia session between the participants.

At any time, either participant MAY generate a new SDP offer that updates the session in progress.

With in the context of WebRTC, the Offer/Answer model defines the state-machinery for WebRTC peers to negotiate session descriptions between them during the initial setup stages as well as for eventual session updates. Javascript Session Establishment Protocol specification [[I-D.ietf-rtcweb-jsep](#)] for WebRTC provides the mechanism for generating [[RFC3264](#)] SDP Offers and Answers in order for both sides of the session to agree upon details such as list of media formats to be sent/received, bandwidth information, crypto parameters, transport parameters, for example.

[5. WebRTC Session Description Examples](#)

A typical web based real-time multimedia communication session can be characterized as below:

- o It has zero or more Audio only, Video only or Audio/Video RTP Sessions,
- o MAY contain zero or more non-media data sessions,
- o All the sessions are secured with DTLS-SRTP,
- o Supports NAT traversal using ICE mechanism,
- o Provides RTCP based feedback mechanisms,
- o Sessions can be over IPv4-only, IPv6-only, dual-stack based clients.

[Page 6]

5.1. Some Conventions

The examples given in this document follow the conventions listed below:

- o In all the examples, Alice and Bob are assumed to be the WebRTC peers.
- o It is assumed that for most of the examples, the support for [[I-D.ietf-mmusic-sdp-bundle-negotiation](#)] is established apriori either out-of-band or as a consequence of successful Offer/Answer negotiation between Alice and Bob, unless explicitly stated otherwise.
- o Call-flow diagrams that accompany the use-cases capture only the prominent aspects of the system behavior and intentionally is not detailed to improve readability.
- o Eventhough the call-flow diagrams shows SDP being exchanged between the parties, it doesn't represent the only way an WebRTC setup is expected to work. Other approaches may involve WebRTC applications to exchange the media setup information via non-SDP mechanisms as long as they confirm to the [[I-D.ietf-rtcweb-jsep](#)] API specification.
- o The SDP examples deviate from actual on-the-wire SDP notation in several ways. This is done to facilitate readability and to conform to the restrictions imposed by the RFC formatting rules.
 - * Visual markers/Empty lines in any SDP example are inserted to make functional divisions in the SDP clearer, and are not actually part of the SDP syntax.
 - * Any SDP line that is indented (compared to the initial line in the SDP block) is a continuation of the preceding line. The line break and indent are to be interpreted as a single space character.
 - * Excepting the above two conventions, line endings are to be interpreted as <CR><LF> pairs (that is, an ASCII 13 followed by an ASCII 10).
- o Against each SDP line, pointers to the appropriate RFCs are provided for further informational reference. Also an attempt has been made to provide explanatory notes to enable better understanding of the SDP usage, wherever appropriate.

Nandakumar & Jennings

Expires January 8, 2017

[Page 7]

- o Following SDP details are common across all the use-cases defined in this document unless mentioned otherwise.
 - * DTLS fingerprint for SRTP (a=fingerprint)
 - * RTP/RTCP Multiplexing (a=rtcp-mux)
 - * RTCP Feedback support (a=rtcp-fb)
 - * Host and server-reflexive candidate lines (a=candidate)
 - * SRTP Setup framework parameters (a=setup)
 - * RTCP attribute (a=rtcp)
 - * RTP header extension indicating audio-levels from client to the mixer

For specific details, readers must refer to [[I-D.ietf-rtcweb-jsep](#)] specification.

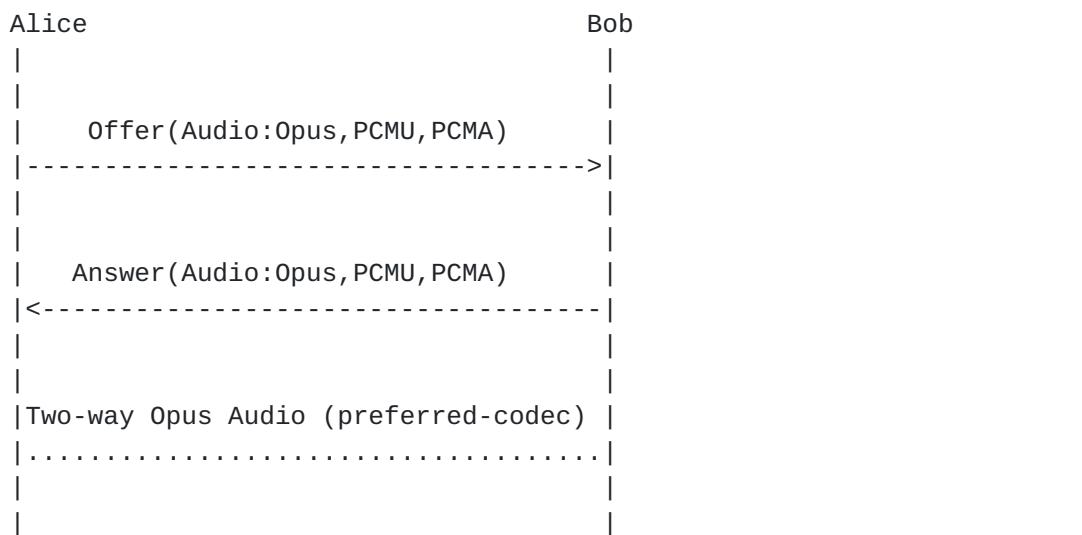

- o The term "Session" is used rather loosely in this document to refer to either a "Communication Session" or a "RTP Session" or a "RTP Stream" depending on the context.
- o Payload type 109 is usually used for OPUS, 0 for PCMU, 8 for PCMA, 99 for H.264 and 120 for VP8 in most of the examples to maintain uniformity.
- o The IP Address:Port combinations '192.168.1.4:61665' (host) and '24.23.204.141:54609' (Server Reflexive) is typically used for Alice.
- o The IP Address:Port combinations '192.168.1.7:51556' (host) and '98.248.92.77:49203' (Server Reflexive) is typically used for Bob.
- o SSRC cname 'cname:EocUG1f0fcg/yvY7' applies to Alice and the cname 'cname:Q/NWs1ao1HmN4Xa5' corresponds to Bob.
- o The SSRCs values '12345', '56789' and '11111' till '66666' usually represent Alice's RTP Streams and the values '54321', '98765' and '77777' till '99999' represent Bob's RTP Streams.
- o In the actual use the values that represent SSRCs, ICE candidate foundations, WebRTC Mediastream and MediaStreamTrack Ids shall be much larger and/or random than the ones shown in the examples.

[5.2.](#) Basic Examples

[5.2.1.](#) Audio Only Session

This common scenario shows SDP for secure two-way audio session with Alice offering Opus, PCMU, PCMA and Bob accepting all the offered audio codecs.

Table 8: 5.2.4 SDP Answer

[5.2.5. Audio with DTMF Session](#)

In this example, Alice wishes to establish two separate audio streams, one for normal audio and the other for telephone-events. Alice offers first audio stream with three codecs and the other with [[RFC2833](#)] tones (for DTMF). Bob accepts both the audio streams by choosing Opus as the audio codec and telephone-event for the other stream.

Audio Session with DTMF

```

Alice                                Bob
|                               |
|                               |
|----->| Offer(Audio:Opus,PCMU,PCMA Audio:telephone-event)
|-----<| Answer(Audio:Opus, Audio:telephone-event)
|-----<| Opus audio stream and telephone-event stream
|.....|
|-----<|
```

Table 12: 5.2.6 SDP Answer

5.2.7. Audio, Video Session with BUNDLE Support Unknown

In this example, since Alice is unsure of the Bob's support of the BUNDLE framework, following steps are performed in order to negotiate and setup a BUNDLE Address for the session

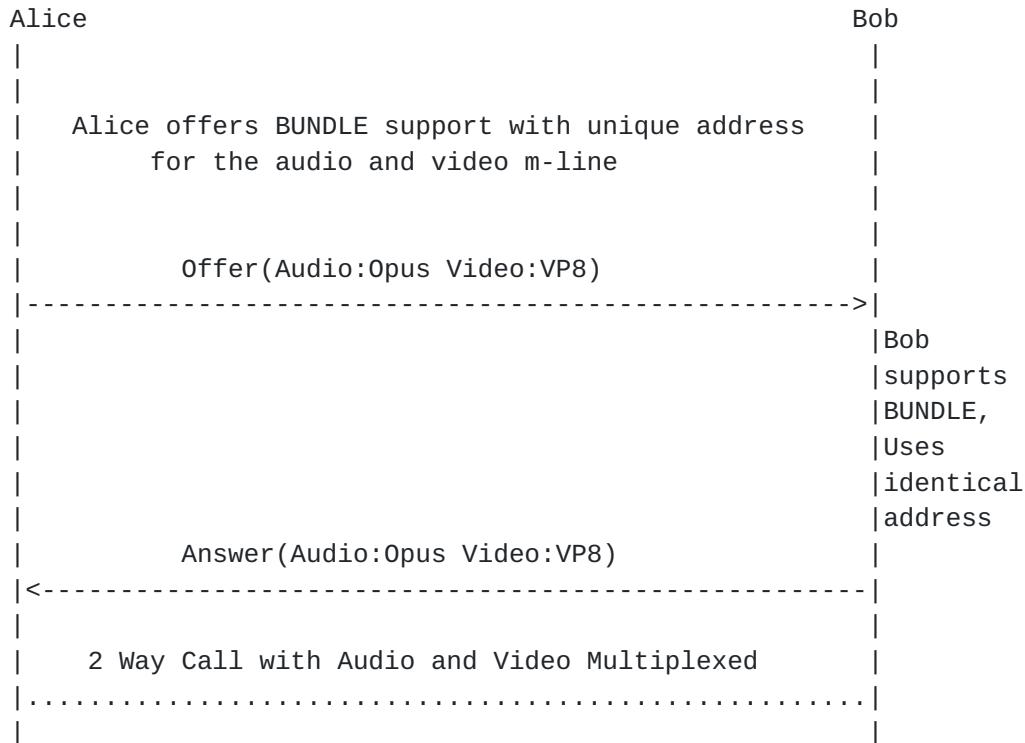

- o An SDP Offer, in which the Alice assigns unique addresses to each "m=" line in the BUNDLE group, and requests the Answerer to select the Offerer's BUNDLE address.
- o An SDP Answer, in which the Bob indicates its support for BUNDLE, selects the offerer's BUNDLE address, selects its own BUNDLE address and associates it with each BUNDLED m=line within the BUNDLE group.

Nandakumar & Jennings Expires January 8, 2017

[Page 30]

Once the Offer/Answer exchange completes, both Alice and Bob each end up using single RTP Session for both the Media Streams.

Table 16: 5.2.8 SDP Answer

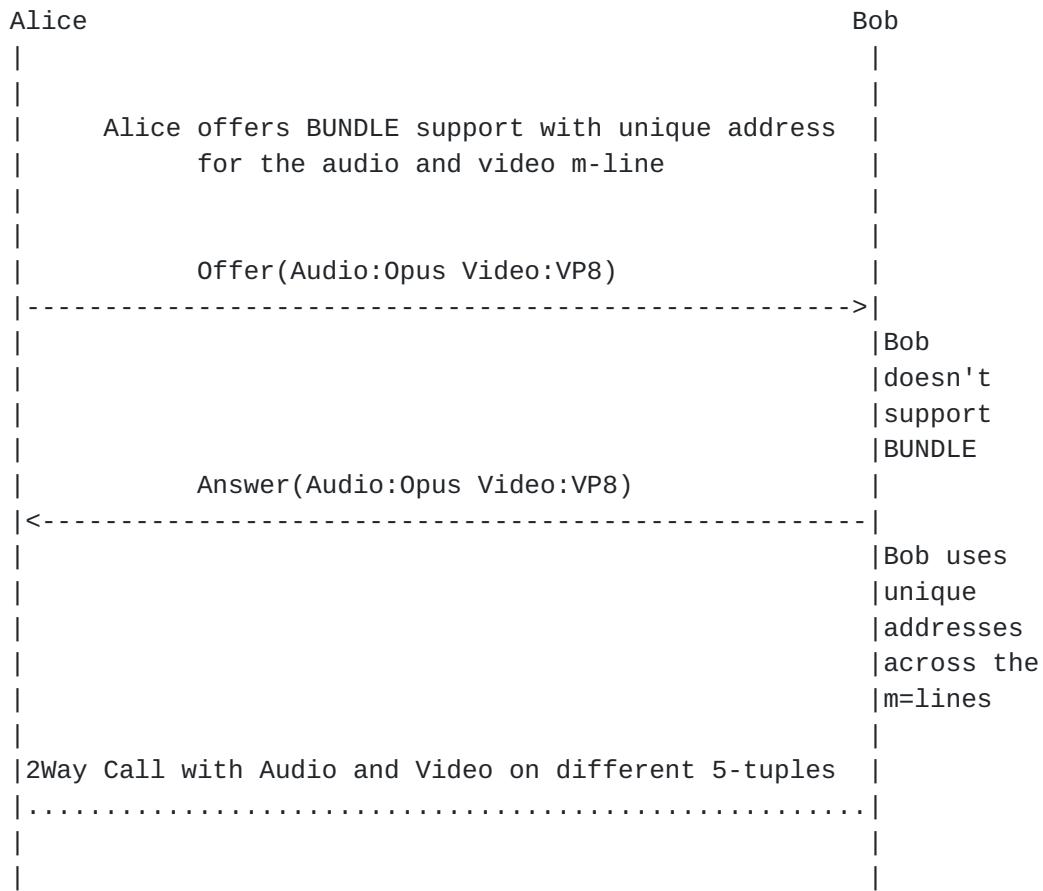

5.2.9. Audio, Video Session with BUNDLE Unsupported

This use-case illustrates SDP Offer/Answer exchange where the far-end (Bob) either doesn't support media bundling or doesn't want to group m=lines over a single 5-tuple.

The same is indicated by dropping the "a=group:BUNDLE" line and BUNDLE RTP header extension in the Answer SDP.

On successful Offer/Answer exchange, Alice and Bob each end up using unique 5-tuple for audio and video media streams respectively.

Table 18: 5.2.9 SDP Answer without BUNDLE

5.2.10. Audio, Video BUNDLED, but Data (Not BUNDLED)

This example show-cases SDP for negotiating a session with Audio, Video and data streams between Alice and Bob with data stream not being part of the BUNDLE group. This is shown by assigning unique port for data media section and not adding the "mid" identification tag to the BUNDLE group.

Table 20: 5.2.10 SDP Answer

[5.2.11. Audio Only, Add Video to BUNDLE](#)

This example involves 2 Offer/Answer exchanges. First one is used to negotiate and setup BUNDLE support for Audio-only session followed by an updated Offer/Answer exchange to add video stream to the ongoing session. Also the newly added video stream is BUNDLED with the audio stream.

Table 24: 5.2.11 SDP Updated Answer

Nandakumar & Jennings

Expires January 8, 2017

[Page 56]

5.3. MultiResolution, RTX, FEC Examples

This section deals with scenarios related to multi-source, multi-stream negotiation such as layered coding, simulcast, along with techniques that deal with providing robustness against transmission errors such as FEC and RTX. Also to note, mechanisms such as FEC and RTX could be envisioned in the above basic scenarios as well.

5.3.1. Sendonly Simulcast Session with 2 cameras and 2 encodings per camera

The SDP below shows Offer/Answer exchange with one audio and two video sources. Each of the video source can be sent at two different resolutions.

One video source corresponds to VP8 encoding, while the other corresponds to H.264 encoding.

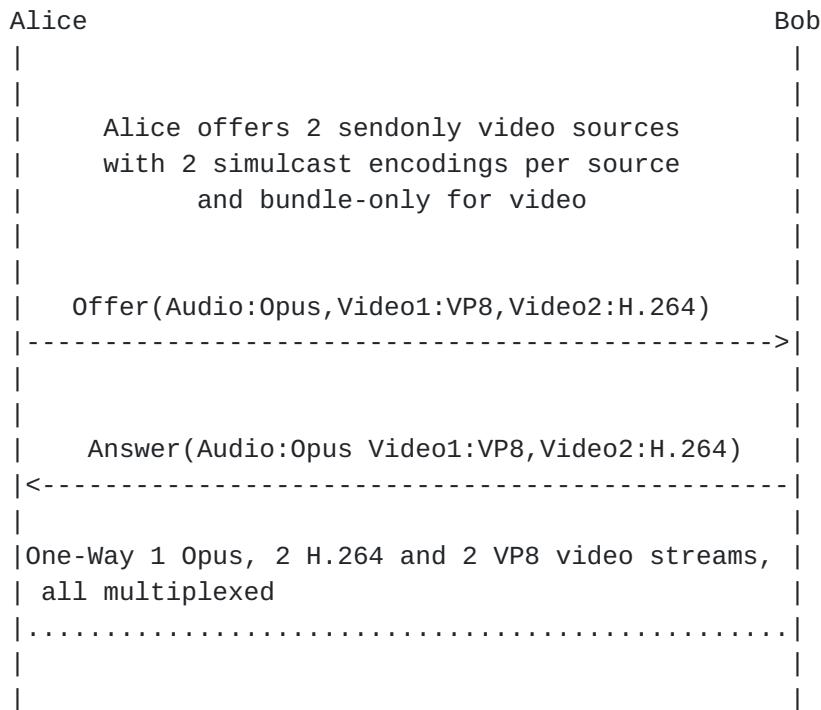

[I-D.ietf-mmmusic-rid] framework is used to further constrain the media format encodings and map the payload types (PT) to the 'rid' identifiers.

[I-D.ietf-mmmusic-sdp-simulcast] framework identifies the simulcast streams via their 'rid' identifiers.

bundle-only attribute is used for the video sources in the Offer to ensure enabling video sources in the context of BUNDLE alone.

BUNDLE grouping framework enables multiplexing of all the 5 streams (1 audio stream + 4 video streams) over a single RTP Session.

1 Way Successful Simulcast w/BUNDLE

Table 26: 5.3.1 SDP Answer

[5.3.2. Successful SVC Video Session](#)

This section shows an SDP Offer/Answer for a session with an audio and a single video source. The video source is encoded as layered coding at 3 different resolutions based on [RFC5583]. The video m-line shows 3 streams with last stream (payload 100) dependent on streams with payload 96 and 97 for decoding.

Table 28: 5.3.2 SDP Answer with SVC

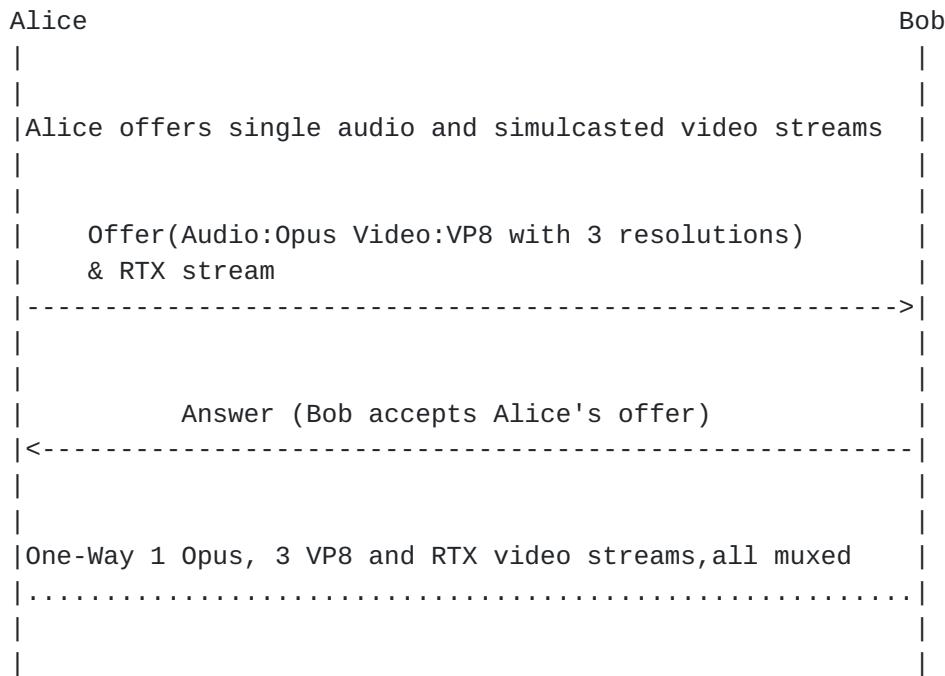

5.3.3. Successful Simulcast Video Session with Retransmission

This section shows an SDP Offer/Answer exchange for a simulcast scenario with 3 resolutions and has [[RFC4588](#)] style re-transmission flows.

[I-D.ietf-mmusic-rid] framework is used to specify all the (3) resolution constraints mapped to a single Payload Type (98).

[I-D.ietf-mmusic-sdp-simulcast] framework identifies the simulcast streams via their 'rid' identifiers.

Table 30: 5.3.3 SDP Answer w/Simulcast, RTX

[5.3.4.](#) Successful 1-way Simulcast Session with 2 resolutions and RTX - One resolution rejected

This section shows an SDP Offer/Answer exchange for a simulcast scenario with 2 two resolutions.

It also showcases where Bob rejects one of the Simulcast Video Stream which results in the rejection of the associated repair stream implicitly.

Simulcast Streams with Retransmission Rejected

Table 32: 5.3.4 SDP Answer (one Simulcast Rejected)

[5.3.5. Simulcast Video Session with Forward Error Correction](#)

This section shows an SDP Offer/Answer exchange for Simulcast video stream at two resolutions and has [[RFC5956](#)] style FEC flows.

On completion of the Offer/Answer exchange mechanism we end up one audio stream, 2 simulcast video streams and 2 associated FEC streams are sent over a single 5-tuple.

Simulcast Streams with Forward Error Correction

Alice

```
|Alice offers single audio and simulcasted video streams
|with bundle-only
```

```
|Offer(Audio:Opus Video:VP8 with 2 resolutions with FEC Streams)|
```

Bob

```
|Bob
|accepts
|Alice's
|offer
```

```
|Answer(Audio:Opus Video:VP8 with 2 resolutions w/FEC Streams)
```

```
|One-Way Audio,Video session with 4 video streams(Simulcast
| and FEC) all multiplexed
```

Table 38: 5.4.2 SDP Answer

5.4.3. Successful legacy Interop Fallback with bundle-only

In the scenario described below, Alice is a multi-stream capable WebRTC endpoint while Bob is a legacy VOIP end-point. The SDP Offer/Answer exchange demonstrates successful session setup with fallback to audio only stream negotiated via bundle-only framework between the end-points. Specifically,

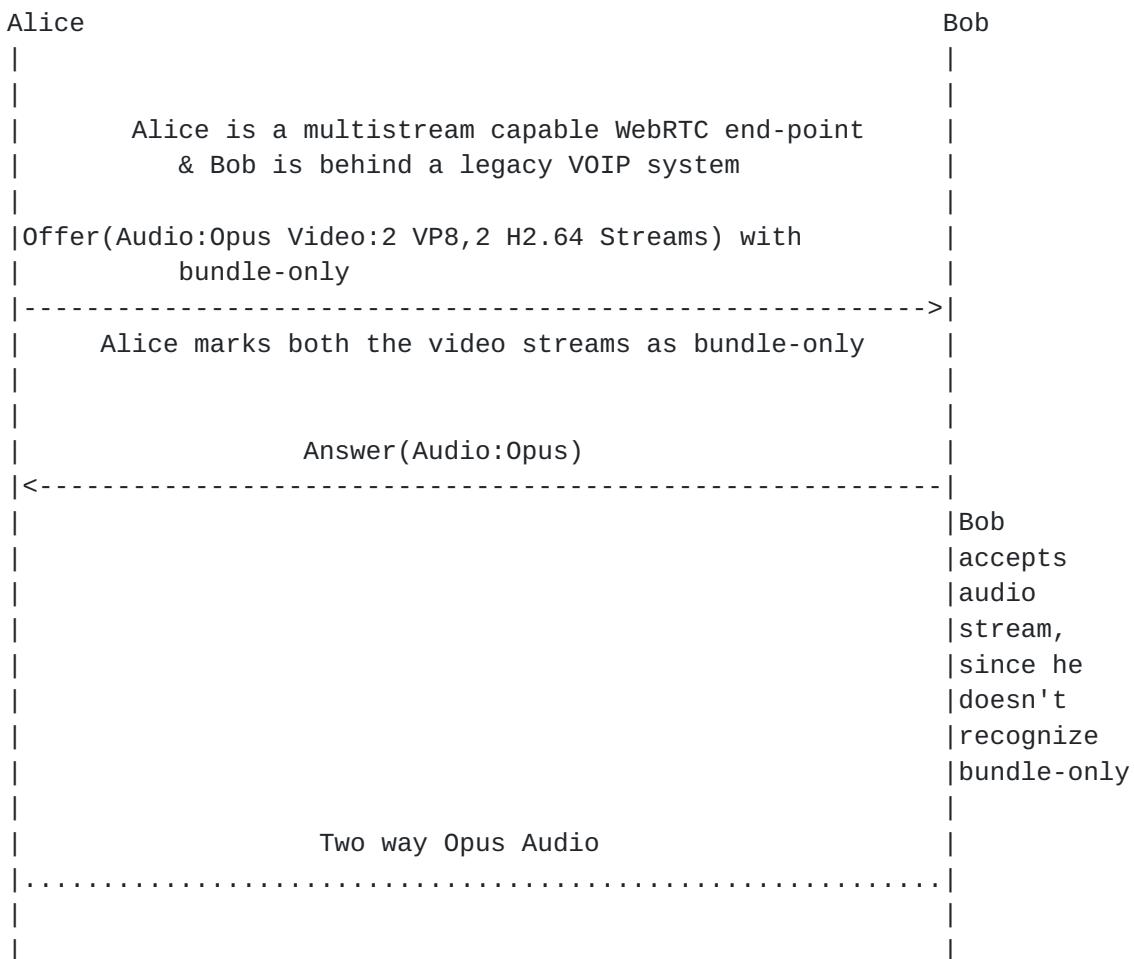

Nandakumar & Jennings Expires January 8, 2017

[Page 90]

- o Offer from Alice describes 2 cameras via 2 video m-lines with both marked as bundle-only.
- o Since Bob does not recognize either the BUNDLE mechanism or the bundle-only attribute, he accepts only the audio stream from Alice.

NOTE: Since Alice is unaware of Bob's support for BUNDLE framework, Alice ensures to include separate RTP/RTCP ports and candidate information.

Successful 2-Way WebRTC <-> VOIP Interop

Table 40: 5.4.3 SDP Answer

5.4.4. Legacy Interop with RTP/AVP profile

In this section, we attempt to provide session descriptions showcasing inter-operability between a WebRTC end-point and a Legacy VOIP end-point. The ideas included in here are not fully baked into the standards and might be controversial in nature. The hope here is to demonstrate a plausible SDP composition to enhance seamless inter-operability between the aforementioned communication systems.

In the scenario described below, Alice is a legacy end-point which sends [[RFC3264](#)] Offer with two sets of media descriptions per media type.

One set that corresponds to [[WebRTC](#)] compliant UDP/TLS/RTP/SAVPF based audio and video descriptions.

Another set with RTP/AVP based audio and video descriptions for the legacy Interop purposes.

Also to note, Alice includes session level DTLS information and media level RTCP feedback information as applicable to both the sets of media descriptions

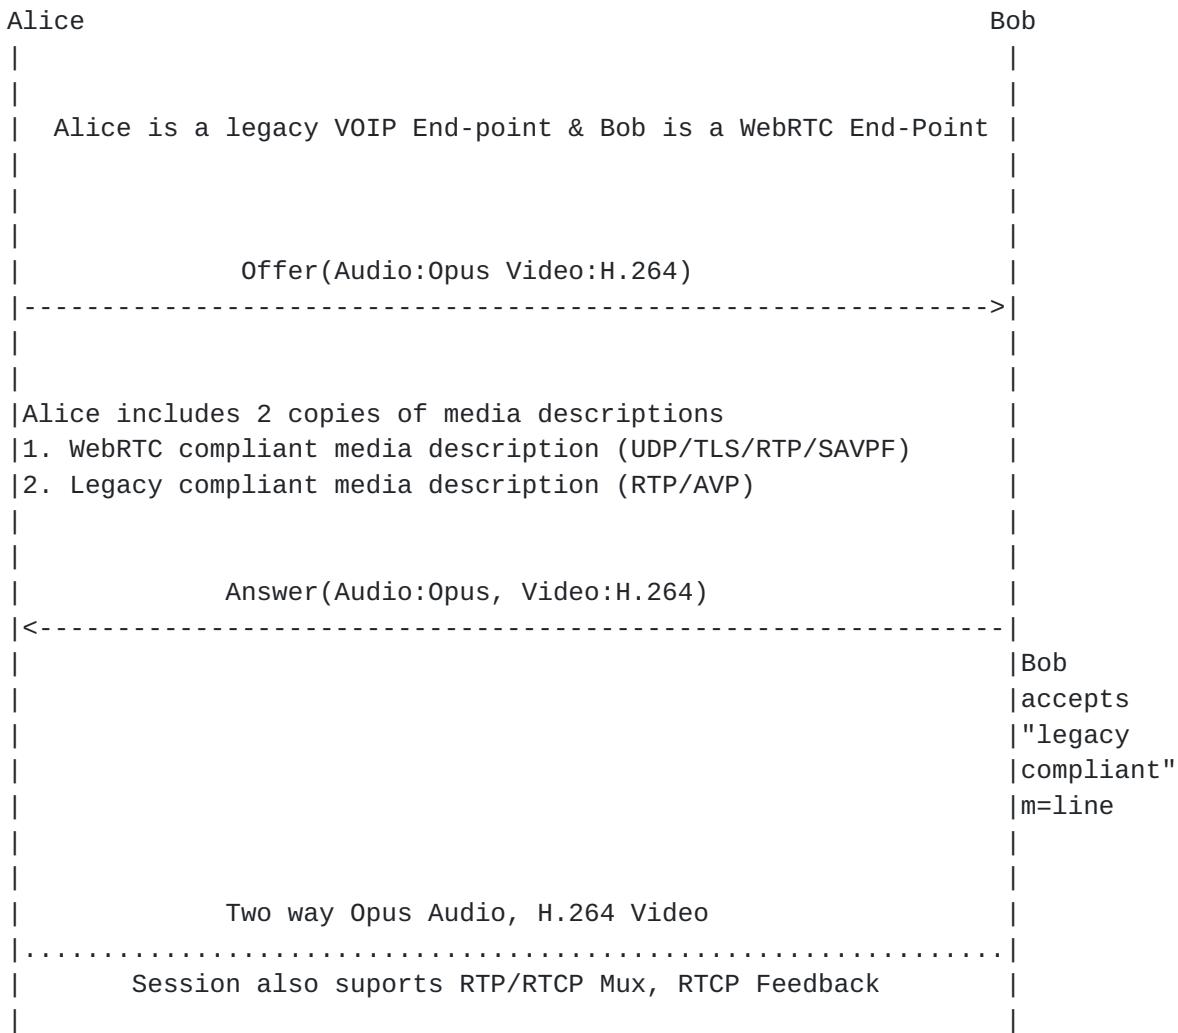

On the other hand, Bob being a WebRTC end-point, recognizes accepts the media descriptions with RTP/AVP profile. The security and feedback requirements for the session are either handled by a intermediate gateway or with some combination of Alice's capabilities and the intermediate gateway.

7. Acknowledgments

We would like to thank Justin Uberti, Chris Flo, Paul Kyzivat for their detailed review and inputs.

8. Change Log

[RFC EDITOR NOTE: Please remove this section when publishing]

Changes from [draft-ietf-rtcweb-sdp-01](#)

- o Complete face-lift
- o Added visual markers around m-lines to indicate their type, added spacing between tables for aiding readers
- o Updated table names to indicate offer vs answer
- o Attempted to align to latest versions of SCTP, BUNDLE, MSID drafts
- o Added mid header extensions to all the lines
- o Harmonized BUNDLE semantics and conventions updated.

Changes from [draft-ietf-rtcweb-sdp-00](#)

- o Updated Simulcast/FEC/RTX examples to use RID framework

- o Fixed BUNDLE references for a=bundle-only

Changes from [draft-nandakumar-rtcweb-sdp-08](#)

- o Fixed typos
- o Moved to a WG version

Changes from [draft-nandakumar-rtcweb-sdp-06](#) and [draft-nandakumar-rtcweb-sdp-07](#)

- o Added clarification on Call-Flow diagram usage
- o More cleanups

Changes from [draft-nandakumar-rtcweb-sdp-05](#)

- o Added Ascii chart for all the SDP Examples
- o Improved text and updated SDP Examples for Simulcast and FEC
- o Fixed MediaStream ID Semantics SDP Errors

Changes from [draft-nandakumar-rtcweb-sdp-04](#)

- o Interim version of the draft to avert expiry
- o Corrected placement of c= line as per [RFC4566](#)
- o Updated simulcast SDP to reflect [draft-westerlund-avtcore-rtp-simulcast-04](#)

Changes from [draft-nandakumar-rtcweb-sdp-03](#)

- o Aligned more closely with JSEP version -05
- o Added Conventions to help readability
- o Add more examples to clarify BUNDLE use-cases

Changes from [draft-nandakumar-rtcweb-sdp-02](#)

- o Major refactoring was done to group the examples in to categories
- o SDP was updated through out to reflect JSEP-04 style of defining attributes per m=line than at the session level.
- o Added 8 new examples.

- o Updated references for Trickle, Unified Plan
- o Add section to explain the syntax conventions followed in the examples.

Changes from [draft-nandakumar-rtcweb-sdp-01](#)

- o Updated references to OPUS RTP Payload Specification.
- o Updated BUNDLE examples based on the latest [draft-ietf-mmusic-sdp-bundle-negotiation](#).
- o Added examples for multiple audio and video flows based on Unified Plan.
- o Added new examples for RTX and FEC streams
- o Updated Simulcast and SVC examples

Changes from [draft-nandakumar-rtcweb-sdp-00](#)

- o Fixed editorial comments on the mailing list.
- o Updated Data-channel SDP information based on [draft-ietf-mmusic-sctp-sdp](#).
- o Updated BUNDLE examples based on [draft-ietf-mmusic-sdp-bundle-negotiation](#).
- o Added examples for few more BUNDLE variants
- o Added new examples for Simulcast and SVC
