**YANG Data Model for ARP**  
**draft-ietf-rtgwg-arp-yang-model-00**

Abstract

This document defines a YANG data model to describe Address Resolution Protocol (ARP) configurations. The data model performs as a guideline for configuring ARP capabilities on a system. It is intended this model be used by service providers who manipulate devices from different vendors in a standard way.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on February 25, 2019.

## [1.](#) Introduction

This document defines a YANG [[RFC7950](#)] data model for Address Resolution Protocol [[RFC826](#)] implementation and identification of some common properties within a device. Devices have common properties that need to be configured and monitored in a standard way. This document is intended to present universal ARP protocol configuration and many vendors can implement it.

The data model covers configuration of system parameters of ARP, such as static ARP entries, timeout for dynamic ARP entries, interface ARP, proxy ARP, and so on. It also provides information about running state of ARP implementations.

### [1.1.](#) Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#), [[RFC2119](#)].

The following terms are defined in [[RFC6241](#)] and are not redefined here:

- o client
- o configuration data
- o server
- o state data

## **[1.2.](#) Tree Diagrams**

A simplified graphical representation of the data model is presented in [Section 3](#).

- o Brackets "[" and "]" enclose list keys.
- o Abbreviations before data node names: "rw" means configuration (read-write) and "ro" state data (read-only).
- o Symbols after data node names: "?" means an optional node, "!" means a presence container, and "\*" denotes a list and leaf-list.
- o Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").
- o Ellipsis ("...") stands for contents of subtrees that are not shown.

Tree diagrams used in this document use the notation defined in [\[RFC8340\]](#).

## **[2.](#) Problem Statement**

This document defines a YANG [\[RFC7950\]](#) configuration data model that may be used to configure the ARP feature running on a system. Data model "ietf-ip" [\[I-D.ietf-netmod-rfc7277bis\]](#) covers the address mapping functionality. However, this functionality is strictly dependent on IPv4 networks, and many ARP related functionalities are missing, e.g. device global ARP entries and control, configuration related to dynamic ARP learning, proxy ARP, gratuitous ARP, etc.

The data model makes use of the YANG "feature" construct which allows implementations to support only those ARP features that lie within their capabilities. It is intended this model be used by service providers who manipulate devices from different vendors in a standard way.

This model can be used to configure the ARP applications for discovering the link layer address associated with a given Internet layer address.

### **3. Design of the Data Model**

This data model intends to describe the processing that a protocol finds the hardware address, also known as Media Access Control (MAC) address, of a host from its known IP address. These tasks include, but are not limited to, adding a static entry in the ARP cache, configuring dynamic ARP learning, proxy ARP, gratuitous ARP. There are two kind of ARP configurations: global ARP configuration, which is across all interfaces on the device, and per interface ARP configuration.

#### **3.1. ARP Caching**

ARP caching is the method of storing network addresses and the associated data-link addresses in memory for a period of time as the addresses are learned. This minimizes the use of valuable network resources to broadcast for the same address each time a datagram is sent.

There are static ARP cache entries and dynamic ARP cache entries. Static entries are manually configured and kept in the cache table on a permanent basis. Dynamic entries are added by vendor software, kept for a period of time, and then removed. We can specify how long an entry remains in the ARP cache. If we specify a timeout of 0 seconds, entries are never cleared from the ARP cache.

#### **3.2. proxy ARP**

Proxy ARP [[RFC1027](#)] can be configured to enable the switch to respond to ARP queries for network addresses by offering its own Ethernet media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

#### **3.3. gratuitous ARP**

Gratuitous ARP requests help detect duplicate IP addresses. A gratuitous ARP is a broadcast request for a router's own IP address. If a router or switch sends an ARP request for its own IP address and no ARP replies are received, the router- or switch-assigned IP address is not being used by other nodes. However, if a router or switch sends an ARP request for its own IP address and an ARP reply is received, the router- or switch-assigned IP address is already being used by another node.

### 3.4. ietf-arp Module

This module has one top level container, ARP, which consists of two second level containers, which are used for static entries configuration and global parameters control.

```

module: ietf-arp
  +--rw arp
    +--rw global-static-entries {global-static-entries}?
      | +--rw static-entry* [ip-address]
      |   +--rw ip-address      inet:ipv4-address-no-zone
      |   +--rw mac-address     yang:mac-address
    +--rw global-control
      +--rw enable-learning?    boolean
      +--rw enable-proxy?      boolean
augment /if:interfaces/if:interface:
  +--rw arp-dynamic-learning
    +--rw expire-time?         uint32
    +--rw learn-disable?      boolean
    +--rw proxy
      | +--rw mode              enumeration
    +--rw probe
      | +--rw interval?         uint8
      | +--rw times?           uint8
      | +--rw unicast?         boolean
    +--rw gratuitous
      | +--rw gratuitous-enable? boolean
      | +--rw interval?         uint32
      | +--rw drop?            boolean
    +--ro statistics
      +--ro in-requests-pkts?   uint16
      +--ro in-replies-pkts?    uint16
      +--ro in-gratuitous-pkts? uint16
      +--ro out-requests-pkts?  uint16
      +--ro out-replies-pkts?   uint16
      +--ro out-gratuitous-pkts? uint16
augment /if:interfaces/if:interface/ip:ipv4/ip:neighbor:
  +--ro remaining-expire-time?  uint32

```

## 4. ARP YANG Module

This section presents the ARP YANG module defined in this document. This YANG module imports typedefs from [\[RFC6991\]](#).

## [5.](#) Data Model Examples

This section presents a simple but complete example of configuring static ARP entries and dynamic learning, based on the YANG modules specified in [Section 4](#).

### [5.1.](#) Static ARP Entries

Requirement:

Enable static ARP entry global configuration (not rely on interface).

```
<config xmlns:xc="urn:ietf:params:xml:ns:netconf:base:1.0">
  <arp xmlns="urn:ietf:params:xml:ns:yang:ietf-arp">
    <static-tables>
      <ip-address> 10.2.2.3 </ip-address>
      <mac-address> 00e0-fc01-0000 </mac-address>
    </static-tables>
  </arp>
```

Requirement:

Enable static ARP entry configuration on interface (defined in draft [[I-D.ietf-netmod-rfc7277bis](#)]).

```
<config xmlns:xc="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ipv4 xmlns="urn:ietf:params:xml:ns:yang:ietf-ip">
    <neighbor>
      <ip-address> 10.2.2.3 </ip-address>
      <mac-address> 00e0-fc01-0000 </mac-address>
      <if-name> GE1/0/1 </if-name>
    </neighbor>
  </ipv4>
```

### [5.2.](#) ARP Dynamic Learning

**Requirement:**

Enable ARP dynamic learning configuration.

```
<config xmlns:xc="urn:ietf:params:xml:ns:netconf:base:1.0">
  <arp-dynamic-learning xmlns="urn:ietf:params:xml:ns:yang:ietf-arp-
dynamic-learning">
    <if-name> GE1/0/1 </if-name>
    <expire-time>1200</expire-time>
    <learn-disable>false</learn-disable>
    <proxy-enable>false</proxy-enable>
  <probe>
    <interval>5</interval>
    <times>3</times>
    <unicast>false</unicast>
  </probe>
  <gratuitous>
    <gratuitous-enable>false</gratuitous-enable>
    <interval>60</interval>
    <drop>false</drop>
    <gratuitous>
  </arp-dynamic-learning>
```

## 6. Security Considerations

The YANG module defined in this document is designed to be accessed via YANG based management protocols, such as NETCONF [[RFC6241](#)] and RESTCONF [[RFC8040](#)]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [[RFC6536](#)] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

These are the subtrees and data nodes and their sensitivity/vulnerability:

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations.

## 7. Acknowledgments

The authors wish to thank Alex Campbell and Reshad Rahman, Qin Wu, many others for their helpful comments.
