YANG Models for Quality of Service (QoS)
draft-ietf-rtgwg-qos-model-07

Abstract

This document describes a YANG model for configuration of Quality of Service (QoS) configuration in network devices. This document doesn't describe QoS statistics counters.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 7 September 2022.

[1.](#) Introduction

This document defines a base YANG [[RFC6020](#)] [[RFC7950](#)] model for Quality of Service (QoS) configuration parameters. QoS base modules

define the basic building blocks to define a classifier, policy, action and target. The base models are augmented to include packet match fields and action parameters to define the Diffrentiated Services (DiffServ) module. Queues and schedulers are stitched as part of diffserv policy model. Separate models have been defined for

creating Queue policy and Scheduling policy. The DiffServ model is based on DiffServ architecture, and various references have been made to available standard architecture documents.

DiffServ is a preferred approach for network service providers to offer services to different customers based on their network Quality-of-Service (QoS) objectives. The traffic streams are differentiated based on DiffServ Code Points (DSCP) carried in the IP header of each packet. The DSCP markings are applied by upstream node or by the edge router on entry to the DiffServ network.

The YANG modules in this document conform to the Network Management Datastore Architecture (NMDA) [[RFC8342](#)].

Tree diagrams used in this document follow the notation defined in [[RFC8340](#)]

[1.1.](#) Note to RFC Editor

Editorial Note: (To be removed by RFC Editor)

This draft contains several placeholder values that need to be replaced with finalized values at the time of publication. Please apply the following replacements:

- * "XXXX" --> the assigned RFC value for this draft both in this draft and in the yang modules under the revision statement.
- * The "revision" date in model, in the format XXXX-XX-XX, needs to be updated with the date the draft gets approved.

[1.2.](#) Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP](#)

[14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

[1.3](#). Definitions and Acronyms

This document uses definitions and acronyms defined in Definitions of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers [[RFC2474](#)], An Architecture for Differentiated Services [[RFC2475](#)], and other documents. Here are some of them.

- * Classifier: an entity which selects packets based on the content of packet headers according to defined rules.

- * DiffServ: Differentiated Services enhancements to the Internet protocol are intended to enable scalable service discrimination in the Internet without the need for per-flow state and signaling at every hop. A variety of services may be built from a small, well-defined set of building blocks which are deployed in network nodes.
- * DSCP: Differentiated Services Code Point
- * Marking: the process of setting the DS codepoint in a packet based on defined rules; pre-marking, re-marking.
- * Metering: the process of measuring the temporal properties (e.g., rate) of a traffic stream selected by a classifier. The instantaneous state of this process may be used to affect the operation of a marker, shaper, or dropper, and/or may be used for accounting and measurement purposes.
- * Policing: the process of discarding packets (by a dropper) within a traffic stream in accordance with the state of a corresponding meter enforcing a traffic profile.
- * RED: Random Early Detection
- * Shaping: the process of delaying packets within a traffic stream to cause it to conform to some defined traffic profile.
- * WRED: Weighted Random Early Detection

[2.](#) QoS Model Design

A classifier consists of packets which may be grouped when a logical set of rules are applied on different packet header fields. The grouping may be based on different values or range of values of same packet header field, presence or absence of some values or range of values of a packet field or a combination thereof. The QoS classifier is defined in the `ietf-qos-classifier` module.

A classifier entry contains one or more packet conditioning functions. A packet conditioning function is typically based on direction of traffic and may drop, mark or delay network packets. A set of classifier entries with corresponding conditioning functions when arranged in order of priority represents a QoS policy. A QoS policy may contain one or more classifier entries. These are defined in `ietf-qos-policy` module.

Actions are configured in line with respect to the policy module. These include marking, dropping or shaping. Actions are defined in the `ietf-qos-action` module.

A meter qualifies if the traffic arrival rate is based on agreed upon rate and variability. A meter is modeled based on commonly used algorithms in industry, Single Rate Tri Color Marking (srTCM) [[RFC2697](#)] meter, Two Rate Tri Color Marking (trTCM) [[RFC2698](#)] meter, and Single Rate Two Color Marking meter. Different vendors can extend it with other types of meters as well.

[3.](#) DiffServ Model Design

DiffServ architecture [[RFC3289](#)] and [[RFC2475](#)] describe the architecture as a simple model where traffic entering a network is classified and possibly conditioned at the boundary of the network and assigned a different Behavior Aggregate (BA). Each BA is identified by a specific value of DSCP, and is used to select a Per Hop Behavior (PHB).

The packet classification policy identifies the subset of traffic which may receive a DiffServ by being conditioned or mapped. Packet

classifiers select packets within a stream based on the content of some portion of the packet header. There are two types of classifiers, the BA classifier, and the Multi-Field (MF) classifier which selects packets based on a value which is combination of one or more header fields. In the ietf-diffserv module, this is realized by augmenting the QoS classification module.

Traffic conditioning includes metering, shaping and/or marking. A meter is used to measure the traffic against a given traffic profile. The traffic profile specifies the temporal property of the traffic. A packet that arrives is first determined to be in or out of the profile, which will result in the action of marked, dropped or shaped. This is realized in vendor specific modules based on the parameters defined in action module. The metering parameters are augmented to the QoS policy module when metering is defined inline, and to the metering template when metering profile is referred in policy module.

[4.](#) Modules Tree Structure

This document defines seven YANG modules - four QoS base modules, a scheduler policy module, a queuing policy module and one DiffServ module.

ietf-qos-classifier consists of classifier entries identified by a classifier entry name. Each entry MAY contain a list of filter entries. When no filter entry is present in a classifier entry, it matches all traffic.

```
module: ietf-qos-classifier
  +--rw classifiers {classifier-template-feature}?
    +--rw classifier* [name]
      +--rw name          string
      +--rw description?  string
      +--rw filter-operation? identityref
      +--rw filter* [type logical-not]
      ...
```

Figure 1: ietf-qos-classifier tree diagram

An ietf-qos-policy module contains list of policy objects identified by a policy name and policy type which MUST be provided. With different values of policy types, each vendor MAY define their own construct of policy for different QoS functionalities. Each vendor MAY augment classifier entry in a policy definition with a set of actions.

```

module: ietf-qos-policy
  +--rw policies
    +--rw policy* [name type]
      +--rw name          string
      +--rw type           identityref
      +--rw description?  string
      +--rw classifier* [name]
        ...

```

Figure 2: ietf-qos-policy tree diagram

ietf-qos-action module contains grouping of set of QoS actions. These include metering, marking, dropping and shaping. Marking sets DiffServ codepoint value in the classified packet. Color-aware and Color-blind meters are augmented by vendor specific modules based on the parameters defined in action module.

```

module: ietf-qos-action
  +--rw meters
    +--rw meter* [name] {meter-template-support}?
      +--rw name          string
      +--rw (meter-type)?
        ...

```

Figure 3: ietf-qos-actions tree diagram

ietf-qos-target module contains reference of qos-policy and augments ietf-interfaces [[RFC8343](#)] module. A single policy of a particular policy-type can be applied on an interface in each direction of traffic. Policy-type is of type identity and is populated in a vendor specific manner. This way it provides greater flexibility for each vendor to define different policy types each with its own

capabilities and restrictions.

Classifier, metering and queuing counters are associated with a target.

```
module: ietf-qos-target

augment /if:interfaces/if:interface:
  +--rw qos-target-policy* [direction type]
    +--rw direction      identityref
    +--rw type            identityref
    +--rw name            string
```

Figure 4: ietf-qos-target tree diagram

Diffserv module augments QoS classifier module. Many of the YANG types defined in [[RFC6991](#)] are represented as leaves in the classifier module.

Metering and marking actions are realized by augmenting the QoS policy-module. Any queuing, AQM and scheduling actions are part of vendor specific augmentation. Statistics are realized by augmenting the QoS target module.

[Appendix A](#). Company A, Company B and Company C examples

Company A, Company B and Company C Diffserv modules augments all the filter types of the QoS classifier module as well as the QoS policy module that allow it to define marking, metering, min-rate, max-rate actions. Queuing and metering counters are realized by augmenting of the QoS target module.

[A.1](#). Example of Company A Diffserv Model

The following Company A vendor example augments the qos and diffserv model, demonstrating some of the following functionality:

- use of template based classifier definitions
- use of single policy type modelling queue, scheduler policy, and a filter policy. All of these policies either augment the qos policy or the diffserv modules
- use of inline actions in a policy
- flexibility in marking dscp or metadata at ingress and/or egress.

```
module example-compa-diffserv {
  yang-version 1.1;
  namespace "urn:ietf:params:xml:ns:yang:example-compa-diffserv";
  prefix example;

  import ietf-qos-classifier {
    prefix classifier;

[A.2.](#) Example of Company B Diffserv Model

The following vendor example augments the qos and diffserv model, demonstrating some of the following functionality:

- use of inline classifier definitions (defined inline in the policy vs referencing an externally defined classifier)
- use of multiple policy types, e.g. a queue policy, a scheduler policy, and a filter policy. All of these policies either augment the qos policy or the diffserv modules
- use of a queue module, which uses and extends the queue grouping from the ietf-qos-action module
- use of meter templates (v.s. meter inline)
- use of internal meta data for classification and marking

```

module example-compb-diffserv-filter-policy {

[A.3.](#) Example of Company C Diffserv Model

Company C vendor augmentation is based on Ericsson's implementation differentiated QoS. This implementation first sorts traffic based on a classifier, which can sort traffic into one or more traffic forwarding classes. Then, a policer or meter policy references the classifier and its traffic forwarding classes to specify different service levels for each traffic forwarding class.

Because each classifier sorts traffic into one or more traffic forwarding classes, this type of classifier does not align with `ietf-qos-classifier.yang`, which defines one traffic forwarding class per

classifier. Additionally, Company C's policing and metering policies relies on the classifier's pre-defined traffic forwarding classes to provide differentiated services, rather than redefining the patterns within a policing or metering policy, as is defined in `ietf-diffserv.yang`.

Due to these differences, even though Company C uses all the building blocks of classifier and policy, Company C's augmentation does not use `ietf-diffserv.yang` to provide differentiated service levels. Instead, Company C's augmentation uses the basic building blocks, `ietf-qos-policy.yang` to provide differentiated services.
