A YANG Data Model for Virtual Router Redundancy Protocol (VRRP)
[draft-ietf-rtgwg-yang-vrrp-07](#)

Abstract

This document describes a data model for Virtual Router Redundancy Protocol (VRRP). Both version 2 and version 3 of VRRP are covered.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on April 30, 2018.

[1. Introduction](#)

This document introduces a YANG [[RFC6020](#)][[RFC7950](#)] data model for Virtual Router Redundancy Protocol (VRRP) [[RFC3768](#)][[RFC5798](#)]. VRRP provides higher resiliency by specifying an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP routers on a LAN.

This YANG model supports both version 2 and version 3 of VRRP. VRRP version 2 defined in [[RFC3768](#)] supports IPv4. VRRP version 3 defined in [[RFC5798](#)] supports both IPv4 and IPv6.

[1.1. Terminology](#)

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

The following terms are defined in [[RFC7950](#)] and are not redefined here:

- o augment

Liu, et al.

Expires April 30, 2018

[Page 2]

- o data model
- o data node

1.2. Tree Diagrams

A simplified graphical representation of the data model is used in this document. The meaning of the symbols in these diagrams is as follows:

- o Brackets "[" and "]" enclose list keys.
- o Curly braces "{" and "}" contain names of optional features that make the corresponding node conditional.
- o Abbreviations before data node names: "rw" means configuration (read-write), and "ro" means state data (read-only).
- o Symbols after data node names: "?" means an optional node, "!" means a presence container, and "*" denotes a list and leaf-list.
- o Parentheses enclose choice and case nodes, and case nodes are also marked with a colon ":".
- o Ellipsis ("...") stands for contents of subtrees that are not shown.

1.3. Prefixes in Data Node Names

In this document, names of data nodes, actions, and other data model objects are often used without a prefix, as long as it is clear from the context in which YANG module each name is defined. Otherwise, names are prefixed using the standard prefix associated with the corresponding YANG module, as shown in Table 1.

Prefix	YANG module	Reference
yang	ietf-yang-types	[RFC6991]
inet	ietf-inet-types	[RFC6991]
if	ietf-interfaces	[I-D.bjorklund-netmod-rfc7223bis]
ip	ietf-ip	[I-D.bjorklund-netmod-rfc7277bis]

Table 1: Prefixes and Corresponding YANG Modules

[Page 3]

2. Design of the Data Model

2.1. Scope of the Model

The model covers VRRP version 2 [[RFC3768](#)] and VRRP version 3 [[RFC5798](#)] protocols. The model is designed to be implemented on a device where VRRP version 2 or version 3 is implemented. With the help of a proper management protocol, the defined model can be used to:

- o Configure the VRRP version 2 or version 3 protocol.
- o Manage the protocol operational behavior.
- o Retrieve the protocol operational status.
- o Receive the protocol notifications.

2.2. Relations with Interface Model and IP Model

This model augments the interface data model "ietf-interfaces" [[I-D.bjorklund-netmod-rfc7223bis](#)] and the IP management model "ietf-ip" [[I-D.bjorklund-netmod-rfc7277bis](#)]. The augmentation relations are shown as follows:

```
module: ietf-interfaces
  +-rw interfaces
    +-rw interface* [name]
      ...
      +-rw ip:ipv4!
        |  +-rw ip:address* [ip]
          ...
          |  +-rw vrrp:vrrp
          |    +-rw vrrp:vrrp-instance* [vrid]                                uint8
          |    +-rw vrrp:vrid
          |    +-rw vrrp:virtual-ipv4-addresses
          ...
          +-rw ip:ipv6!
            +-rw ip:address* [ip]
            ...
            +-rw vrrp:vrrp
              +-rw vrrp:vrrp-instance* [vrid]                                uint8
              +-rw vrrp:vrid
              +-rw vrrp:virtual-ipv6-addresses
              ...
```

Liu, et al.

Expires April 30, 2018

[Page 4]

In the above figure, a tree node without a prefix is from the model "ietf-interfaces". A tree node with prefix "ip:" is from the model "ietf-ip". A tree node with prefix "vrrp:" is from the VRRP model specified in this document.

The "vrrp" container contains a list of vrrp-instance nodes, which are instantiated under an interface for a specified address family (IPv4 or IPv6).

Each vrrp-instance node represents a VRRP router state machine described in [Section 6.4 of \[RFC5798\]](#), providing the configuration and state information for the election process of a virtual router. The IP addresses on the augmented interface are the real addresses through which the VRRP router operates. The IPv4 or IPv6 address(es) associated with a virtual router (described in [Section 1 of \[RFC5798\]](#)) are modeled as a list of IPv4 or IPv6 addresses under the vrrp-instance.

2.3. Protocol Configuration

The model structure for the protocol configuration is as shown below:

```

augment /if:interfaces/if:interface/ip:ipv4:
  +-rw vrrp
    +-rw vrrp-instance* [vrid]
      +-rw vrid                                uint8
      |
      ...
      +-rw track
        | +-rw interfaces
        | | +-rw interface* [interface]
        | |   +-rw interface          if:interface-ref
        | |
        | ...
        | +-rw networks
        |   +-rw network* [prefix]
        |     +-rw prefix            inet:ipv4-prefix
        |   ...
        |
        +-rw virtual-ipv4-addresses
          +-rw virtual-ipv4-address* [ipv4-address]
            +-rw ipv4-address      inet:ipv4-address

augment /if:interfaces/if:interface/ip:ipv6:
  +-rw vrrp
    +-rw vrrp-instance* [vrid]
      +-rw vrid                                uint8
      |
      ...
      +-rw track
        | +-rw interfaces
        | | +-rw interface* [interface]
        | |   +-rw interface          if:interface-ref
        | |
        | ...
        | +-rw networks
        |   +-rw network* [prefix]
        |     +-rw prefix            inet:ipv6-prefix
        |   ...
        |
        +-rw virtual-ipv6-addresses
          +-rw virtual-ipv6-address* [ipv6-address]
            +-rw ipv6-address      inet:ipv6-address

```

The model allows to configure the following protocol entities:

- o VRRP instance (version 2 or version 3), representing a VRRP router.
- o Virtual IPv4 or IPv6 address associated with a virtual router.
- o Tracking interface, to detect interface connectivity failures.
- o Tracking network, to detect interface connectivity failures.

Liu, et al.

Expires April 30, 2018

[Page 6]

[2.4. Protocol States](#)

The model structure for the protocol states is as shown below:

```

module: ietf-vrrp
  +-+ro vrrp
    +-+ro <global operational states>
    +-+ro statistics
      +-+ro discontinuity-datetime? yang:date-and-time
      +-+ro <global statistics>

augment /if:interfaces/if:interface/ip:ipv4:
  +-+rw vrrp
    +-+rw vrrp-instance* [vrid]
      +-+rw vrid                                uint8
      |
      ...
      +-+rw track
        |   +-+rw interfaces
        |   |   +-+rw interface* [interface]
        |   |   +-+rw interface          if:interface-ref
        |   |
        |   ...
        |   +-+rw networks
        |   |   +-+rw network* [prefix]
        |   |   +-+rw prefix           inet:ipv4-prefix
        |   |
        |   ...
        +-+rw virtual-ipv4-addresses
          |   +-+rw virtual-ipv4-address* [ipv4-address]
          |   |   +-+rw ipv4-address   inet:ipv4-address
          |
          +-+ro <per instance operational states>
          +-+ro statistics
            +-+ro <per instance statistics>

augment /if:interfaces/if:interface/ip:ipv6:
  +-+rw vrrp
    +-+rw vrrp-instance* [vrid]
      +-+rw vrid                                uint8
      +
      ...
      +-+rw track
        |   +-+rw interfaces
        |   |   +-+rw interface* [interface]
        |   |   +-+rw interface          if:interface-ref
        |   |
        |   ...
        |   +-+rw networks
        |   |   +-+rw network* [prefix]
        |   |   +-+rw prefix           inet:ipv6-prefix
        |   |
        |   ...

```

```
+--rw virtual-ipv6-addresses
|  +-rw virtual-ipv6-address* [ipv6-address]
|    +-rw ipv6-address    inet:ipv6-address
|
+--ro <per instance operational states>
+-ro statistics
  +-ro <per instance statistics>
```

This model conforms to the Network Management Datastore Architecture (NMDA) [[I-D.ietf-netmod-revised-datastores](#)]. The operational state data is combined with the associated configuration data in the same hierarchy [[I-D.ietf-netmod-rfc6087bis](#)]. When protocol states are retrieved from the NMDA operational state datastore, the returned states cover all "config true" (rw) and "config false" (ro) nodes defined in the schema.

The model allows to retrieve protocol states at the following levels:

- o VRRP instance (version 2 or version 3), representing a VRRP router.
- o Virtual IPv4 or IPv6 address associated with a virtual router.
- o Tracking interface, to detect interface connectivity failures.
- o Tracking network, to detect interface connectivity failures.
- o Global states and statistics summarizing all instances.

[2.5. Notifications](#)

This model defines the following VRRP specific notifications:

```

notifications:
  +--n vrrp-new-master-event
    |  +-+ro master-ip-address      inet:ip-address
    |  +-+ro new-master-reason     new-master-reason-type
  +--+n vrrp-protocol-error-event
    |  +-+ro protocol-error-reason  identityref
  +--+n vrrp-virtual-router-error-event
    +-+ro interface                  if:interface-ref
    +-+ro (ip-version)
    |  +-:(ipv4)
    |  |  +-+ro ipv4
    |  |  +-+ro vrid    leafref
    |  +-:(ipv6)
    |  |  +-+ro ipv6
    |  |  +-+ro vrid    leafref
    +-+ro virtual-router-error-reason  identityref

```

Each notification type is used to indicate a type of VRRP state changes or error occurrences:

vrrp-new-master-event

VRRP new master event, indicating that a new master has been elected.

vrrp-protocol-error-event

VRRP protocol error event for a message that fails to reach a VRRP instance to be processed.

vrrp-virtual-router-error-event

VRRP virtual router error event for a message processed on a VRRP instance.

In addition to the notifications specified above, the mechanism defined in [[I-D.ietf-netconf-yang-push](#)] and [[I-D.ietf-netconf-rfc5277bis](#)] can be used for other general notifications. This mechanism currently allows the user to:

- o Subscribe notifications on a per client basis.
- o Specify subtree filters or xpath filters so that only interested contents will be sent.
- o Specify either periodic or on-demand notifications.

3. YANG Module

```
<CODE BEGINS> file "ietf-vrrp@2017-10-25.yang"

4. IANA Considerations

RFC Ed.: In this section, replace all occurrences of 'XXXX' with the actual RFC number (and remove this note).

This document registers the following namespace URIs in the IETF XML registry [[RFC3688](#)]:

```
-----  
URI: urn:ietf:params:xml:ns:yang:ietf-vrrp  
Registrant Contact: The IESG.  
XML: N/A, the requested URI is an XML namespace.  
-----
```

This document registers the following YANG modules in the YANG Module Names registry [[RFC7950](#)]:

```
-----  
name:          ietf-vrrp  
namespace:     urn:ietf:params:xml:ns:yang:ietf-vrrp  
prefix:        vrrp  
reference:    RFC XXXX  
-----
```

5. Security Considerations

The configuration, state, and action data defined in this document are designed to be accessed via a management protocol with a secure transport layer, such as NETCONF [[RFC6241](#)]. The NETCONF access control model [[RFC6536](#)] provides the means to restrict access for particular NETCONF users to a preconfigured subset of all available NETCONF protocol operations and contents.

A number of configuration data nodes defined in this document are writable/creatable/deletable (i.e., "config true" in YANG terms, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations to these data nodes, such as "edit-config" in NETCONF, can have negative effects on the network if the protocol operations are not properly protected. The vulnerable "config true" parameters and subtrees are the following:

```
/if:interfaces/if:interface/ip:ipv4/vrrp:vrrp:vrrp-instance  
/if:interfaces/if:interface/ip:ipv6/vrrp:vrrp:vrrp-instance
```

Unauthorized access to any node of these can adversely affect the routing subsystem of both the local device and the network. This may lead to network malfunctions, delivery of packets to inappropriate destinations, and other problems.

[Appendix B. Data Tree Example](#)

This section contains an example of an instance data tree in the JSON encoding [[RFC7951](#)], containing both configuration and state data.

The configuration instance data for Router 1 in the above figure could be as follows:

```
{
  "ietf-interfaces:interfaces": {
    "interface": [
      {
        "name": "eth1",
        "type": "iana-if-type:ethernetCsmacd",
        "description": "An interface with VRRP enabled.",
        "ietf-ip:ipv4": {
          "address": [
            {
              "ip": "192.0.2.11",
              "prefix-length": 24
            }
          ],
          "forwarding": true,
          "ietf-vrrp:vrrp": {
            "vrrp-instance": [
              {
                "vrid": 1,
                "version": "vrrp-v3",
                "priority": 200,
                "advertise-interval-centi-sec": 50,
                "virtual-ipv4-addresses": {
                  "virtual-ipv4-address": [
                    "ipv4-address": "192.0.2.1"
                  ]
                }
              }
            ]
          }
        }
      }
    ]
  }
}
```

The cooresponding operational state data for Router 1 could be as follows:

```
{
  "ietf-interfaces:interfaces": {
    "interface": [
      {
        "name": "eth1",
        "type": "iana-if-type:ethernetCsmacd",
        "phys-address": "00:0C:42:E5:B1:E9",
        "oper-status": "up",
        "ietf-vrrp:vrrp": {
          "vrrp-instance": [
            {
              "vrid": 1,
              "version": "vrrp-v3",
              "priority": 200,
              "advertise-interval-centi-sec": 50,
              "virtual-ipv4-addresses": {
                "virtual-ipv4-address": [
                  "ipv4-address": "192.0.2.1"
                ]
              }
            }
          ]
        }
      }
    ]
  }
}
```

```
"statistics": {
    "discontinuity-time": "2016-10-24T17:11:27+02:00"
},
"ietf-ip:ipv4": {
    "forwarding": true,
    "mtu": 1500,
    "address": [
        {
            "ip": "192.0.2.11",
