SECSH Public Key File Format

STATUS OF THIS MEMO:

Abstract

This document formally documents the existing public key file format in use for exchanging public keys between different SECSH implementations.

1. Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC-2119].

2. Introduction

In order to use public key authentication, public keys must be exchanged between client and server. This document formally describes the existing public key file format, with few exceptions.

Where this document departs from current practice, it also suggests a mechanism for backwards compatibility.

3. Key File Format

SECSH implementations must share public key files between the client and the server in order interoperate.

A key file is a text file, containing a sequence of lines. Each line in the file MUST NOT be longer than 72 bytes.

3.1 Line termination Characters

In order to achieve the goal of being able to exchange public key files between servers, implementations are REQUIRED to read files using any of the common line termination sequence, <CR>, <LF> or <CR><LF>.

Implementations may generate files using which ever line termination convention is most convenient

4. Begin and end markers

The first line of a conforming key file MUST be a begin marker, which is the literal text:

---- BEGIN SSH2 PUBLIC KEY ----

The last line of a conforming key file MUST be a end marker, which is the literal text:

---- END SSH2 PUBLIC KEY ----

5. Key File Header

The key file header section consists of multiple RFC822 - style header fields. Each field is a line of the following format:

Header-tag ':' ' ' Header-value

The Header-tag MUST NOT be more than 64 bytes. The Header-value MUST NOT be more than 1024 bytes. Each line in the header MUST NOT be more than 72 bytes.

A line is continued if the last character in the line is a '\'. If the last character of a line is a '\', then the logical contents of the line is formed by removing the '\' and appending the contents of the next line.

The Header-tag MUST be US-ASCII. The Header-value MUST be encoded in UTF-8 ([RFC-2044]).

A line that is not a continuation line that has no ':' in it is assumed to be the first line of the base 64 encoded body (Section 8)

Compliant implementations MUST ignore unrecognized header fields. Implementations SHOULD preserve unrecognized header fields when manipulating the key file.

Existing implementations may not correctly handle unrecognized fields. During a transition period, implementations SHOULD generate key file headers that contain only a Subject field followed by a Comment field.

6. Subject Header

This field currently is used to store the login-name that the key was generated under. For example:

Subject: user

7. Comment Header

Contain a user specified comment which will be displayed when using the key.

It is suggested that this field default to user@hostname for the user and machine used to generate the key. For example:

Comment: user@mycompany.com

Currently, common practice is to quote the Header-value of the Comment, and some existing implementations fail if these quotes are omitted.

Compliant implementations MUST function correctly if the quotes are omitted.

During an interim period implementations MAY include the quotes. If the first and last characters of the Header-value are matching quotes, implementations SHOULD remove them before using the value.

8. Public Key File Body

The body of a public key file consists of the public key blob as described in [SSH-TRANS], section 4.6, "Public Key Algorithms", encoded in base 64 as specified in [RFC-2045] section 6.8, "Base64 Content-Transfer-Encoding".

As with all other lines, each line in the body MUST NOT be longer than 72 characters.

9. Examples

The following are some example public key files that are compliant:

```
---- BEGIN SSH2 PUBLIC KEY ----
Comment: "1024-bit RSA, converted from OpenSSH by galb@test1"
AAAAB3NzaC1yc2EAAAABIwAAAIEA1on8gxCGJJWSRT4uOrR13mUaUk0hRf4RzxSZ1zRbYY
