Definitions of Managed Objects for the RPKI-Router Protocol draft-ietf-sidr-rpki-rtr-protocol-mib-04

Abstract

This document defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes objects used for monitoring the RPKI Router protocol.

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on June 2, 2013.

Table of Contents

1. Introduction

This document defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it defines objects used for monitoring the RPKI Router protocol [I-D.ietf-sidr-rpki-rtr].

1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

2. Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of [RFC3410]. Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This document specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, [RFC2578], STD 58, [RFC2579] and STD 58, [RFC2580].

3. Overview

The objects defined in this document are used to monitor the RPKI Router protocol [I-D.ietf-sidr-rpki-rtr]. The MIB module defined in this draft is broken into these tables: the RPKI Router Cache Server (connection) Table, the RPKI Router Cache Server Errors Table, and the RPKI Router Prefix Origin Table.

The RPKI Router Cache Server Table contains information about state and current activity of connections with the RPKI Router Cache Servers. It also contains counters for the number of messages received and sent plus the number of announcements, withdrawals and active records. The RPKI Router Cache Server Errors Table contains counters of occurrences of errors on the connections (if any). The RPKI Router Prefix Origin Table contains IP prefixes with their minimum and maximum prefix lengths and the Origin AS. This data is the collective set of information received from all RPKI Cache Servers that the router is connected with. The Cache Servers are running the RPKI Router protocol.

Two Notification have been defined to inform a Network Management Station (NMS) or operators about changes in the connection state of the connections listed in the RPKI Cache Server (Connection) Table.

4. Definitions

The Following MIB module imports definitions from [RFC2578], STD 58, [RFC2579] STD 58, [RFC2580], [RFC4001], [RFC2287]. That means we have a normative reference to those documents.

The MIB module also has a normative reference to the RPKI Router protocol [I-D.ietf-sidr-rpki-rtr]. Furthermore, for background and informative information, the MIB module refers to [RFC1982], [RFC5925], [RFC4252], [RFC5246], [RFC5925].

    rpkiRtrCacheServerRefreshTimer OBJECT-TYPE
        SYNTAX       Unsigned32 (60..7200)
        UNITS       "seconds"
        MAX-ACCESS   read-only
        STATUS       current
        DESCRIPTION "The number of seconds configured for the refresh
                     timer for this connection to this RPKI cache
                     server."
        ::= { rpkiRtrCacheServerTableEntry 20 }

    rpkiRtrCacheServerTimeToRefresh OBJECT-TYPE
        SYNTAX       Integer32
        UNITS       "seconds"
        MAX-ACCESS   read-only
        STATUS       current
        DESCRIPTION "The number of seconds remaining before a new
                     refresh is performed via a Serial Query to
                     this cache server over this connection.

                     A negative value means that the refresh time
                     has passed this many seconds and the refresh
                     has not yet been completed.

                     Upon a completed refresh (i.e. a successful
                     and complete response to a Serial Query) the
                     value of this attribute will be re-initialized
                     with the value of the corresponding
                     rpkiRtrCacheServerRefreshTimer attribute."

                        rpkiRtrCacheServerConnectionToGoStale
                      }
        STATUS      current
        DESCRIPTION "The set of notifications to alert an NMS of change
                     in connections to RPKI cache servers."
        ::= { rpkiRtrGroups 4 }

    END
```

5. IANA Considerations

The MIB module in this document will required an IANA assigned OBJECT IDENTIFIER within the SMI Numbers registry. For example, replacing XXX below:

Descriptor	OBJECT IDENTIFIER value

```
        rpkiRouter            { mib-2 XXX }
```

6. Security Considerations

There are no management objects defined in this MIB module that have a MAX-ACCESS clause of read-write and/or read-create. So, if this MIB module is implemented correctly, then there is no risk that an intruder can alter or create any management objects of this MIB module via direct SNMP SET operations.

Most of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. They are vulnerable in the sense that when an intruder sees the information in this MIB module, then it might help him/her to setup a an attack on the router or cache server. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

Implementations MUST provide the security features described by the SNMPv3 framework (see [RFC3410]), including full support for authentication and privacy via the User-based Security Model (USM) [RFC3414] with the AES cipher algorithm [RFC3826]. Implementations MAY also provide support for the Transport Security Model (TSM) [RFC3591] in combination with a secure transport such as SSH [RFC3592] or TLS/DTLS [RFC3593]

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.
