Use of Elliptic Curve Cryptography (ECC) Algorithms  
in Cryptographic Message Syntax (CMS)  
draft-ietf-smime-3278bis-01.txt

#### Status of this Memo

By submitting this Internet-Draft, each author represents that any applicable patent or other IPR claims of which he or she is aware have been or will be disclosed, and any of which he or she becomes aware will be disclosed, in accordance with [Section 6 of BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at  
<http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at  
<http://www.ietf.org/shadow.html>

This Internet-Draft will expire on December 30, 2008.

#### Abstract

This document describes how to use Elliptic Curve Cryptography (ECC) public-key algorithms in the Cryptographic Message Syntax (CMS). The ECC algorithms support the creation of digital signatures and the exchange of keys to encrypt or authenticate content. The definition

Internet-Draft

RFC 3278bis

June 2008

of the algorithm processing is based on the ANSI X9.62 standard, developed by the ANSI X9F1 working group, the IEEE 1363 standard, and the SEC 1 standard.

## Discussion

This draft is being discussed on the 'ietf-smime' mailing list. To subscribe, send a message to [ietf-smime-request@imc.org](mailto:ietf-smime-request@imc.org) with the single word subscribe in the body of the message. There is a Web site for the mailing list at <http://www.imc.org/ietf-smime/>.

## [1.](#) Introduction

The Cryptographic Message Syntax (CMS) is cryptographic algorithm independent. This specification defines a profile for the use of

Elliptic Curve Cryptography (ECC) public key algorithms in the CMS. The ECC algorithms are incorporated into the following CMS content types:

- 'SignedData' to support ECC-based digital signature methods (ECDSA) to sign content
- 'EnvelopedData' to support ECC-based public-key agreement methods (ECDH and ECMQV) to generate pairwise key-encryption keys to encrypt content-encryption keys used for content encryption
- 'AuthenticatedData' to support ECC-based public-key agreement methods (ECMQV) to generate pairwise key-encryption keys to encrypt MAC keys used for content authentication and integrity.

Certification of EC public keys is also described to provide public-key distribution in support of the specified techniques.

### [1.1](#). Requirements Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[MUST](#)].

### [1.2](#). Changes since [RFC 3278](#)

The following summarizes the changes:

- [Section 2.1](#) added sentence indicating SHA is used with EDSA.
- [Section 2.1.1](#) limited the digest algorithm to SHA-1. This document expands the allowed algorithms to SHA-224, SHA-256, SHA-384, and SHA-512.
- [Section 2.1.2](#) and 2.1.3 - Delete e paragraph and update ANSI X9.42 references.
- [Section 3.1](#) - Updates reference to CMS-ALG vice CMS for DH.
- [Section 3.1.1](#) used SHA1 in the KDF with ECDH std and cofactor methods. This document expands the set of allowed algorithms by

adding SHA-224, SHA-256, SHA-384, and SHA-512.

- [Section 3.2.1](#) used SHA1 in the KDF with ECMQV. This document expands the set of allowed algorithms by adding SHA-224, SHA-256, SHA-384, and SHA-512.
- [Section 4.2](#) was added to address ECMQV use of AuthEnvelopedData.

- [Section 5](#) is updated to include requirements for hash algorithms and recommendations for matching curves and hash algorithms. It also was expanded to indicate which ECDH and ECMQV variants, key wrap algorithms, and content encryption algorithms are required for each of the content types used in this document..
- [Section 7](#) is updated to include S/MIME capabilities for ECDSA with SHA-224, SHA-256, SHA-384, and SHA-512. It was also updated to include S/MIME capabilities for ECDH and ECMQV using SHA2 algorithms as the KDF.
- [Section 8.1](#) listed the algorithm identifiers for SHA-1 and SHA-1 with ECDSA. This document adds algorithm identifiers for SHA-224, SHA-256, SHA-384, and SHA-512 as well as SHA-224, SHA-256, SHA-384, and SHA-512 with ECDSA. This document also updates the list of algorithm identifiers for ECDH std, ECDH cofactor, and ECMQV with SHA2 algorithms as the KDF.
- Deleted summary paragraph.
- Updated references.
- Updated security considerations. Security considerations paragraph referring to definitions of SHA-224, SHA-256, SHA-384, and SHA-512 is deleted.
- Added ASN.1 modules.
- Updated acknowledgements section.

## [2.](#) SignedData using ECC

This section describes how to use ECC algorithms with the CMS

SignedData format to sign data.

## [2.1.](#) SignedData using ECDSA

This section describes how to use the Elliptic Curve Digital Signature Algorithm (ECDSA) with SignedData. ECDSA is specified in [\[X9.62\]](#). The method is the elliptic curve analog of the Digital Signature Algorithm (DSA) [\[DSS\]](#). ECDSA is used with the Secure Hash Algorithm (SHA) [\[SHS\]](#).

In an implementation that uses ECDSA with CMS SignedData, the following techniques and formats MUST be used.

### [2.1.1.](#) Fields of the SignedData

When using ECDSA with SignedData, the fields of SignerInfo are as in [\[CMS\]](#), but with the following restrictions:

digestAlgorithm MUST contain the algorithm identifier of the hash algorithm (see [Section 8.1](#)) which MUST be one of the following: id-sha1 identifies the SHA-1 hash algorithm, id-sha224 identifies the SHA-224 hash algorithm, id-sha256 identifies the SHA-256 hash algorithm, id-sha384 identifies the SHA-384 algorithm, and id-sha512 identifies the SHA-512 algorithm.

signatureAlgorithm contains the signature algorithm identifier (see [Section 8.1](#)): ecdsa-with-SHA1, ecdsa-with-SHA224, ecdsa-with-SHA256, ecdsa-with-SHA384, or ecdsa-with-SHA512.

signature MUST contain the DER encoding (as an octet string) of a value of the ASN.1 type ECDSA-Sig-Value (see [Section 8.2](#)).

When using ECDSA, the SignedData certificates field MAY include the certificate(s) for the EC public key(s) used in the generation of the ECDSA signatures in SignedData. ECC certificates are discussed in [Section 6](#).

### [2.1.2.](#) Actions of the sending agent

When using ECDSA with SignedData, the sending agent uses the message digest calculation process and signature generation process for

SignedData that are specified in [CMS]. To sign data, the sending agent uses the signature method specified in [X9.62, [Section 7.3](#)].

The sending agent encodes the resulting signature using the ECDSA-Sig-Value syntax (see [Section 8.2](#)) and places it in the SignerInfosignature field.

### [2.1.3](#). Actions of the receiving agent

When using ECDSA with SignedData, the receiving agent uses the message digest calculation process and signature verification process for SignedData that are specified in [CMS]. To verify SignedData, the receiving agent uses the signature verification method specified in [X9.62, [Section 7.3](#)].

In order to verify the signature, the receiving agent retrieves the integers  $r$  and  $s$  from the SignerInfo signature field of the received message.

## [3](#). EnvelopedData using ECC Algorithms

This section describes how to use ECC algorithms with the CMS EnvelopedData format.

### [3.1](#). EnvelopedData using (ephemeral-static) ECDH

This section describes how to use the ephemeral-static Elliptic Curve Diffie-Hellman (ECDH) key agreement algorithm with EnvelopedData. Ephemeral-static ECDH is specified in [[SEC1](#)] and [[IEEE1363](#)]. Ephemeral-static ECDH is the elliptic curve analog of the ephemeral-static Diffie-Hellman key agreement algorithm specified jointly in the documents [CMS-ALG, [Section 4.1.1](#)] and [CMS-DH].

In an implementation that uses ECDH with CMS EnvelopedData with key agreement, the following techniques and formats MUST be used.

#### [3.1.1](#). Fields of KeyAgreeRecipientInfo

When using ephemeral-static ECDH with EnvelopedData, the fields of KeyAgreeRecipientInfo are as in [CMS], but with the following restrictions:

originator MUST be the alternative originatorKey. The originatorKey algorithm field MUST contain the id-ecPublicKey object identifier (see [Section 8.1](#)) with NULL parameters. The originatorKey publicKey field MUST contain the DER-encoding of a value of the ASN.1 type ECPoint (see [Section 8.2](#)), which represents the sending agent's ephemeral EC public key.

keyEncryptionAlgorithm MUST contain the key encryption algorithm object identifier (see [Section 8.1](#)). The parameters field contains KeyWrapAlgorithm. The KeyWrapAlgorithm is the algorithm identifier that indicates the symmetric encryption algorithm used to encrypt the content-encryption key (CEK) with the key-encryption key (KEK). Algorithm requirements are found in paragraph 5.

### [3.1.2](#). Actions of the sending agent

When using ephemeral-static ECDH with EnvelopedData, the sending agent first obtains the recipient's EC public key and domain parameters (e.g. from the recipient's certificate). The sending agent then determines an integer "keydatalen", which is the KeyWrapAlgorithm symmetric key-size in bits, and also a bit string "SharedInfo", which is the DER encoding of ECC-CMS-SharedInfo (see [Section 8.2](#)). The sending agent then performs the key deployment and

the key agreement operation of the Elliptic Curve Diffie-Hellman Scheme specified in [SEC1, [Section 6.1](#)]. As a result the sending agent obtains:

- an ephemeral public key, which is represented as a value of the type ECPoint (see [Section 8.2](#)), encapsulated in a bit string and placed in the KeyAgreeRecipientInfo originator field, and
- a shared secret bit string "K", which is used as the pairwise key-encryption key for that recipient, as specified in [[CMS](#)].

### [3.1.3](#). Actions of the receiving agent

When using ephemeral-static ECDH with EnvelopedData, the receiving agent determines the bit string "SharedInfo", which is the DER encoding of ECC-CMS-SharedInfo (see [Section 8.2](#)), and the integer "keydatalen" from the key-size, in bits, of the KeyWrapAlgorithm. The receiving agent retrieves the ephemeral EC public key from the bit

string KeyAgreeRecipientInfo originator, with a value of the type ECPoint (see [Section 8.2](#)) encapsulated as a bit string. The receiving agent performs the key agreement operation of the Elliptic Curve Diffie-Hellman Scheme specified in [SEC1, [Section 6.1](#)]. As a result, the receiving agent obtains a shared secret bit string "K", which is used as the pairwise key-encryption key to unwrap the CEK.

### [3.2](#). EnvelopedData using 1-Pass ECMQV

This section describes how to use the 1-Pass elliptic curve MQV (ECMQV) key agreement algorithm with EnvelopedData. ECMQV is specified in [[SEC1](#)] and [[IEEE1363](#)]. Like the KEA algorithm [CMS-KEA], 1-Pass ECMQV uses three key pairs: an ephemeral key pair, a static key pair of the sending agent, and a static key pair of the receiving agent. An advantage of using 1-Pass ECMQV is that it can be used with both EnvelopedData and AuthenticatedData.

In an implementation that uses 1-Pass ECMQV with CMS EnvelopedData with key agreement, the following techniques and formats MUST be used.

#### [3.2.1](#). Fields of KeyAgreeRecipientInfo

When using 1-Pass ECMQV with EnvelopedData, the fields of KeyAgreeRecipientInfo are:

originator identifies the static EC public key of the sender. It SHOULD be one of the alternatives, issuerAndSerialNumber or

subjectKeyIdentifier, and point to one of the sending agent's certificates.

ukm MUST be present. The ukm field MUST contain an octet string which is the DER encoding of the type MQVuserKeyingMaterial (see [Section 8.2](#)). The MQVuserKeyingMaterial ephemeralPublicKey

algorithm field MUST contain the id-ecPublicKey object identifier (see [Section 8.1](#)) with NULL parameters field. The MQVuserKeyingMaterial ephemeralPublicKey publicKey field MUST contain the DER-encoding of the ASN.1 type ECPoint (see [Section 8.2](#)) representing the sending agent's ephemeral EC public key. The MQVuserKeyingMaterial addedukm field, if present, SHOULD

contain an octet string of additional user keying material of the sending agent.

keyEncryptionAlgorithm MUST be the key encryption algorithm identifier (see [Section 8.1](#)), with the parameters field KeyWrapAlgorithm. The KeyWrapAlgorithm indicates the symmetric encryption algorithm used to encrypt the CEK with the KEK generated using the 1-Pass ECMQV algorithm. Algorithm requirements are found in paragraph 5.

### [3.2.2](#). Actions of the sending agent

When using 1-Pass ECMQV with EnvelopedData, the sending agent first obtains the recipient's EC public key and domain parameters, (e.g. from the recipient's certificate) and checks that the domain parameters are the same. The sending agent then determines an integer "keydatalen", which is the KeyWrapAlgorithm symmetric key-size in bits, and also a bit string "SharedInfo", which is the DER encoding of ECC-CMS-SharedInfo (see [Section 8.2](#)). The sending agent then performs the key deployment and key agreement operations of the Elliptic Curve MQV Scheme specified in [SEC1, [Section 6.2](#)]. As a result, the sending agent obtains:

- an ephemeral public key, which is represented as a value of type ECPoint (see [Section 8.2](#)), encapsulated in a bit string, placed in an MQVuserKeyingMaterial ephemeralPublicKey publicKey field (see [Section 8.2](#)), and
- a shared secret bit string "K", which is used as the pairwise key-encryption key for that recipient, as specified in [[CMS](#)].

The ephemeral public key can be re-used with an AuthenticatedData for greater efficiency.

### [3.2.3](#). Actions of the receiving agent

When using 1-Pass ECMQV with EnvelopedData, the receiving agent determines the bit string "SharedInfo", which is the DER encoding of ECC-CMS-SharedInfo (see [Section 8.2](#)), and the integer "keydatalen" from the key-size, in bits, of the KeyWrapAlgorithm. The receiving agent then retrieves the static and ephemeral EC public keys of the originator, from the originator and ukm fields as described in field

and checks that the domain parameters are the same. The receiving agent then performs the key agreement operation of the Elliptic Curve MQV Scheme [SEC1, [Section 6.2](#)]. As a result, the receiving agent obtains a shared secret bit string "K" which is used as the pairwise key-encryption key to unwrap the CEK.

#### [4.](#) AuthenticatedData and AuthEnvelopedData using ECC

This section describes how to use ECC algorithms with the CMS AuthenticatedData format. AuthenticatedData lacks non-repudiation, and so in some instances is preferable to SignedData. (For example, the sending agent might not want the message to be authenticated when forwarded.)

This section also describes how to use ECC algorithms with the CMS AuthEnvelopedData format [[CMS-AUTHENV](#)]. AuthEnvelopedData supports authentication and encryption, and in some instances is preferable to signing and then encrypting data.

##### [4.1.](#) AuthenticatedData using 1-pass ECMQV

This section describes how to use the 1-Pass elliptic curve MQV (ECMQV) key agreement algorithm with AuthenticatedData. ECMQV is specified in [[SEC1](#)]. An advantage of using 1-Pass ECMQV is that it can be used with EnvelopedData, AuthenticatedData, and AuthEnvelopedData.

###### [4.1.1.](#) Fields of the KeyAgreeRecipientInfo

The AuthenticatedData KeyAgreeRecipientInfo fields are used in the same manner as the fields for the corresponding EnvelopedData KeyAgreeRecipientInfo fields of [Section 3.2.1](#) of this document.

###### [4.1.2.](#) Actions of the sending agent

The sending agent uses the same actions as for EnvelopedData with 1-Pass ECMQV, as specified in [Section 3.2.2](#) of this document.

The ephemeral public key can be re-used with an EnvelopedData for greater efficiency.

Note: if there are multiple recipients, an attack is possible where one recipient modifies the content without other recipients noticing [BON]. A sending agent who is concerned with such an attack SHOULD use a separate AuthenticatedData for each recipient.

#### [4.1.3](#). Actions of the receiving agent

The receiving agent uses the same actions as for EnvelopedData with 1-Pass ECMQV, as specified in [Section 3.2.3](#) of this document.

Note: see Note in [Section 4.1.2](#).

#### [4.2](#). AuthEnvelopedData using 1-pass ECMQV

This section describes how to use the 1-Pass elliptic curve MQV (ECMQV) key agreement algorithm with AuthEnvelopedData. ECMQV is specified in [SEC1]. An advantage of using 1-Pass ECMQV is that it can be used with EnvelopedData, AuthenticatedData, and AuthEnvelopedData.

##### [4.2.1](#). Fields of the KeyAgreeRecipientInfo

The AuthEnvelopedData KeyAgreeRecipientInfo fields are used in the same manner as the fields for the corresponding EnvelopedData KeyAgreeRecipientInfo fields of [Section 3.2.1](#) of this document.

##### [4.2.2](#). Actions of the sending agent

The sending agent uses the same actions as for EnvelopedData with 1-Pass ECMQV, as specified in [Section 3.2.2](#) of this document.

The ephemeral public key can be re-used with an EnvelopedData for greater efficiency.

##### [4.2.3](#). Actions of the receiving agent

The receiving agent uses the same actions as for EnvelopedData with 1-Pass ECMQV, as specified in [Section 3.2.3](#) of this document.

### [5](#). Recommended Algorithms and Elliptic Curves

Implementations of this specification MUST implement either SignedData with ECDSA or EnvelopedData with ephemeral-static ECDH. Implementations of this specification SHOULD implement both

SignedData with ECDSA and EnvelopedData with ephemeral-static ECDH. Implementations MAY implement the other techniques specified, such as AuthenticatedData and 1-Pass ECMQV.

Furthermore, in order to encourage interoperability, implementations SHOULD use the elliptic curve domain parameters specified by ANSI [\[X9.62\]](#), NIST [\[DSS\]](#) and SECG [\[SEC2\]](#). It is RECOMMENDED that the P-256 curve be used with SHA-256, the P-384 curve be used with SHA-384, and the P-521 curve be used with SHA-512.

Implementations of this specification MUST implement the SHA-256 hash algorithm. The SHA-1, SHA-224, SHA-384, SHA-512 hash algorithms MAY be supported.

When ECDSA, ECDH, or ECMQV is used, it is RECOMMENDED that the P-256 curve be used with SHA-256, the P-384 curve be used with SHA-384, and the P-521 curve be used with SHA-512.

Implementations of this specification that support EnvelopedData with ephemeral-static ECDH standard primitive MUST support the dhSinglePass-stdDH-sha256kdf-scheme algorithm. They MUST also support the id-aes128-wrap key wrap and id-aes128-cbc content encryption algorithms. The dhSinglePass-stdDH-sha1kdf-scheme, dhSinglePass-stdDH-sha224kdf-scheme, dhSinglePass-stdDH-sha384kdf-scheme, and dhSinglePass-stdDH-sha512kdf-scheme algorithms MAY be supported. Likewise, the id-alg-CMS3DESwrap, id-aes192-wrap, and id-aes256-wrap key wrap algorithms and the id-aes192-cbc and id-aes256-cbc content encryption algorithms MAY be supported.

Implementations of this specification that support EnvelopedData with ephemeral-static ECDH cofactor primitive MUST support the dhSinglePass-cofactorDH-sha256kdf-scheme algorithm. They MUST also support the id-aes128-wrap key wrap and id-aes128-cbc content encryption algorithms. The dhSinglePass-cofactorDH-sha1kdf-scheme, dhSinglePass-cofactorDH-sha224kdf-scheme, dhSinglePass-cofactorDH-sha384kdf-scheme, and dhSinglePass-cofactorDH-sha512kdf-scheme algorithms MAY be supported. Likewise, the id-alg-CMS3DESwrap, id-aes192-wrap, and id-aes256-wrap MAY be supported.

Implementations of this specification that support EnvelopedData with ECMQV MUST support the mqvSinglePass-sha256kdf-scheme algorithm. They MUST also support the id-aes128-wrap and id-aes128-cbc algorithms. The mqvSinglePass-sha1kdf-scheme, mqvSinglePass-sha224kdf-scheme, mqvSinglePass-sha384kdf-scheme, and mqvSinglePass-sha512kdf-scheme algorithms MAY be supported. Likewise, the id-alg-CMS3DESwrap, id-aes192-wrap, and id-aes256-wrap key wrap algorithms and the id-

Internet-Draft

RFC 3278bis

June 2008

aes192-cbc and id-aes256-cbc content encryption algorithms MAY be supported.

Implementations of this specification that support AuthenticatedData with ECMQV MUST support the mqvSinglePass-sha256kdf-scheme algorithm. They MUST also support the id-aes128-wrap key wrap, id-aes128-cbc content encryption, and id-hmacWithSHA256 message digest algorithms. The mqvSinglePass-sha1kdf-scheme, mqvSinglePass-sha224kdf-scheme, mqvSinglePass-sha384kdf-scheme, and mqvSinglePass-sha512kdf-scheme algorithms MAY be supported. Likewise, the id-alg-CMS3DESwrap, id-aes192-wrap, and id-aes256-wrap key wrap algorithms and the id-aes192-cbc and id-aes256-cbc content encryption algorithms MAY be supported. The id-hmacWithSHA1, id-hmacWithSHA224, id-hmacWithSHA384, and id-hmacWithSHA512 MAY be supported.

Implementations of this specification that support AuthEnvelopedData with ECMQV MUST support the mqvSinglePass-sha256kdf-scheme algorithm. They MUST also support the id-aes128-wrap key wrap and id-aes128-cbc content encryption algorithm. The mqvSinglePass-sha1kdf-scheme, mqvSinglePass-sha224kdf-scheme, mqvSinglePass-sha384kdf-scheme, and mqvSinglePass-sha512kdf-scheme algorithms MAY be supported. Likewise, the id-alg-CMS3DESwrap, id-aes192-wrap, and id-aes256-wrap key wrap algorithms and the id-aes192-cbc and id-aes256-cbc content encryption algorithms MAY be supported.

## [6](#). Certificates using ECC

Internet X.509 certificates [[PKI](#)] can be used in conjunction with this specification to distribute agents' public keys. The use of ECC algorithms and keys within X.509 certificates is specified in [[PKI-ALG](#)].

## [7](#). SMIMECapabilities Attribute and ECC

A sending agent MAY announce to receiving agents that it supports one or more of the ECC algorithms in this document by using the SMIMECapabilities signed attribute [MSG, [Section 2.5.2](#)].

Internet-Draft

RFC 3278bis

June 2008

The SMIMECapability value to indicate support for the ECDSA signature algorithm is the SEQUENCE with the capabilityID field containing the object identifiers ecdsa-with-SHA\* object identifiers (where \* is 1, 224, 256, 384, or 512) all with NULL parameters. The DER encodings are:

ecdsa-with-SHA1: 30 0b 06 07 2a 86 48 ce 3d 04 01 05 00

ecdsa-with-SHA224: 30 0c 06 08 2a 86 48 ce 3d 04 03 01 05 00

ecdsa-with-SHA256: 30 0c 06 08 2a 86 48 ce 3d 04 03 02 05 00

ecdsa-with-SHA384: 30 0c 06 08 2a 86 48 ce 3d 04 03 03 05 00

ecdsa-with-SHA512: 30 0c 06 08 2a 86 48 ce 3d 04 03 04 05 00

The SMIMECapability value to indicate support for

- a) the standard ECDH key agreement algorithm,
- b) the cofactor ECDH key agreement algorithm, or
- c) the 1-Pass ECMQV key agreement algorithm

is a SEQUENCE with the capabilityID field containing the object identifier

- a) dhSinglePass-stdDH-sha\*kdf-scheme,
- b) dhSinglePass-cofactorDH-sha\*kdf-scheme, or
- c) mqvSinglePass-sha\*kdf-scheme

respectively (where \* is 1, 224, 256, 384, or 512) with the parameters present. The parameters indicate the supported key-encryption algorithm with the KeyWrapAlgorithm algorithm identifier.

Example DER encodings that indicate some capabilities are as follows (KA is key agreement, KDF is key derivation function, and Wrap is key wrap algorithm):

## [8. ASN.1 Syntax](#)

The ASN.1 syntax used in this document is gathered in this section for reference purposes.

### [8.1. Algorithm Identifiers](#)

The following object identifier indicates the hash algorithm used in this document [[SMIME-SHA2](#)]:

```

id-sha1 OBJECT IDENTIFIER ::= {
    iso(1) identified-organization(3) oiw(14) secsig(3)

```

```

algorithm(2) 26 }

id-sha224 OBJECT IDENTIFIER ::= {
    joint-iso-itu-t(2) country(16) us(840) organization(1) gov(101)
    csor(3) nistalgorithm(4) hashalgs(2) 4 }

id-sha256 OBJECT IDENTIFIER ::= {
    joint-iso-itu-t(2) country(16) us(840) organization(1) gov(101)
    csor(3) nistalgorithm(4) hashalgs(2) 1 }

id-sha384 OBJECT IDENTIFIER ::= {
    joint-iso-itu-t(2) country(16) us(840) organization(1) gov(101)
    csor(3) nistalgorithm(4) hashalgs(2) 2 }

id-sha512 OBJECT IDENTIFIER ::= {
    joint-iso-itu-t(2) country(16) us(840) organization(1) gov(101)
    csor(3) nistalgorithm(4) hashalgs(2) 3 }

```

The following object identifier is used in this document to indicate an elliptic curve public key:

```
id-ecPublicKey OBJECT IDENTIFIER ::= { ansi-x9-62 keyType(2) 1 }
```

where

```
ansi-x9-62 OBJECT IDENTIFIER ::= { iso(1) member-body(2) us(840)
10045 }
```

When the object identifier id-ecPublicKey is used here with an algorithm identifier, the associated parameters contain NULL.

The following object identifier indicates the digital signature algorithm used in this document:

```
ecdsa-with-SHA1 OBJECT IDENTIFIER ::= {
    ansi-x9-62 signatures(4) 1 }
```

```
ecdsa-with-SHA224 OBJECT IDENTIFIER ::= {
    ansi-x9-62 signatures(4) ecdsa-with-SHA2(3) 1 }
```

```
ecdsa-with-SHA256 OBJECT IDENTIFIER ::= {
```

```
ansi-x9-62 signatures(4) ecdsa-with-SHA2(3) 2 }
```

```
ecdsa-with-SHA384 OBJECT IDENTIFIER ::= {  
    ansi-x9-62 signatures(4) ecdsa-with-SHA2(3) 3 }
```

```
ecdsa-with-SHA512 OBJECT IDENTIFIER ::= {  
    ansi-x9-62 signatures(4) ecdsa-with-SHA2(3) 4 }
```

When the object identifiers ecdsa-with-SHA1, ecdsa-with-SHA224, ecdsa-with-SHA256, ecdsa-with-SHA384, or ecdsa-with-SHA512 are used within an algorithm identifier, the associated parameters field contains NULL.

The following object identifiers indicate the key agreement algorithms used in this document:

```
dhSinglePass-stdDH-sha1kdf-scheme OBJECT IDENTIFIER ::= {  
    x9-63-scheme 2 }
```

```
dhSinglePass-stdDH-sha224kdf-scheme OBJECT IDENTIFIER ::= {  
    secg-scheme 11 0 }
```

```
dhSinglePass-stdDH-sha256kdf-scheme OBJECT IDENTIFIER ::= {  
    secg-scheme 11 1 }
```

```
dhSinglePass-stdDH-sha384kdf-scheme OBJECT IDENTIFIER ::= {  
    secg-scheme 11 2 }
```

```
dhSinglePass-stdDH-sha512kdf-scheme OBJECT IDENTIFIER ::= {  
    secg-scheme 11 3 }
```

```
dhSinglePass-cofactorDH-sha1kdf-scheme OBJECT IDENTIFIER ::= {  
    x9-63-scheme 3 }
```

```
dhSinglePass-cofactorDH-sha224kdf-scheme OBJECT IDENTIFIER ::= {  
    secg-scheme 14 0 }
```

```
dhSinglePass-cofactorDH-sha256kdf-scheme OBJECT IDENTIFIER ::= {  
    secg-scheme 14 1 }
```

```
dhSinglePass-cofactorDH-sha384kdf-scheme OBJECT IDENTIFIER ::= {  
    secg-scheme 14 2 }
```

```
dhSinglePass-cofactorDH-sha512kdf-scheme OBJECT IDENTIFIER ::= {
    secg-scheme 14 3 }
```

```
mqvSinglePass-sha1kdf-scheme OBJECT IDENTIFIER ::= {
    x9-63-scheme 16 }
```

```
mqvSinglePass-sha224kdf-scheme OBJECT IDENTIFIER ::= {
    secg-scheme 15 0 }
```

```
mqvSinglePass-sha256kdf-scheme OBJECT IDENTIFIER ::= {
    secg-scheme 15 1 }
```

```
mqvSinglePass-sha384kdf-scheme OBJECT IDENTIFIER ::= {
    secg-scheme 15 2 }
```

```
mqvSinglePass-sha512kdf-scheme OBJECT IDENTIFIER ::= {
    secg-scheme 15 3 }
```

where

```
x9-63-scheme OBJECT IDENTIFIER ::= {
    iso(1) identified-organization(3) tc68(133) country(16)
    x9(840) x9-63(63) schemes(0) }
```

and

```
secg-scheme OBJECT IDENTIFIER ::= {
    iso(1) identified-organization(3) certicom(132) schemes(1) }
```

When the object identifiers are used here within an algorithm identifier, the associated parameters field contains the CMS KeyWrapAlgorithm algorithm identifier.

## [8.2](#). Other Syntax

The following additional syntax is used here.

When using ECDSA with SignedData, ECDSA signatures are encoded using the type:

```
ECDSA-Sig-Value ::= SEQUENCE {
    r INTEGER,
```

s INTEGER }

ECDSA-Sig-Value is specified in [X9.62]. Within CMS, ECDSA-Sig-Value is DER-encoded and placed within a signature field of SignedData.

When using ECDH and ECMQV with EnvelopedData and AuthenticatedData, ephemeral and static public keys are encoded using the type ECPoint.

ECPoint ::= OCTET STRING

When using ECMQV with EnvelopedData and AuthenticatedData, the sending agent's ephemeral public key and additional keying material are encoded using the type:

MQVuserKeyingMaterial ::= SEQUENCE {  
    ephemeralPublicKey OriginatorPublicKey,  
    addedukm [0] EXPLICIT UserKeyingMaterial OPTIONAL }

The ECPoint syntax is used to represent the ephemeral public key and placed in the ephemeralPublicKey field. The additional user keying material is placed in the addedukm field. Then the MQVuserKeyingMaterial value is DER-encoded and placed within a ukm field of EnvelopedData or AuthenticatedData.

When using ECDH or ECMQV with EnvelopedData or AuthenticatedData, the key-encryption keys are derived by using the type:

ECC-CMS-SharedInfo ::= SEQUENCE {  
    keyInfo AlgorithmIdentifier,  
    entityUInfo [0] EXPLICIT OCTET STRING OPTIONAL,  
    suppPubInfo [2] EXPLICIT OCTET STRING }

The fields of ECC-CMS-SharedInfo are as follows:

keyInfo contains the object identifier of the key-encryption algorithm (used to wrap the CEK) and NULL parameters.

entityUInfo optionally contains additional keying material supplied by the sending agent. When used with ECDH and CMS, the entityUInfo field contains the octet string ukm. When used with

ECMQV and CMS, the entityUInfo contains the octet string addedukm (encoded in MQVuserKeyingMaterial).

suppPubInfo contains the length of the generated KEK, in bits, represented as a 32 bit number, as in [CMS-DH]. (E.g. for 3DES it would be 00 00 00 c0.)

Within CMS, ECC-CMS-SharedInfo is DER-encoded and used as input to the key derivation function, as specified in [SEC1, [Section 3.6.1](#)].

Note that ECC-CMS-SharedInfo differs from the OtherInfo specified in [CMS-DH]. Here, a counter value is not included in the keyInfo field because the key derivation function specified in [SEC1, [Section 3.6.1](#)] ensures that sufficient keying data is provided.

## 9. Security Considerations

Cryptographic algorithms will be broken or weakened over time. Implementers and users need to check that the cryptographic algorithms listed in this document continue to provide the expected level of security. The IETF from time to time may issue documents dealing with the current state of the art.

This specification is based on [CMS], [CMS-AUTHENV], [CMS-ALG], [CMS-AESCG], [X9.62], and [SEC1] and the appropriate security considerations of those documents apply.

In addition, implementors of AuthenticatedData should be aware of the concerns expressed in [BON] when using AuthenticatedData to send messages to more than one recipient. Also, users of MQV should be aware of the vulnerability in [K].

When implementing EnvelopedData, AuthenticatedData, and AuthEnvelopedData, there are five algorithm related choices that need to be made:

- 1) What is the public key size?
- 2) What is the KDF?
- 3) What is the key wrap algorithm?
- 4) What is the content encryption algorithm?
- 5) What is the curve?

Consideration must be given to strength of the security provided by each of these choices. Security is measured in bits, where a strong symmetric cipher with a key of X bits is said to provide X bits of security. It is recommended that the bits of security provided by each are roughly equivalent. The following table provides comparable minimum bits of security [[NISTSP800-57](#)] for the ECDH/ECMQV key sizes, KDFs, key wrapping algorithms, and content encryption algorithms. It also lists curves [[PKI-ALG](#)] for the key sizes.

Minimum Bits of Security	ECDH or ECQMV Key Size	Key Derivation Function	Key Wrap Alg.	Content Encryption Alg.	Curves
80	160-223	SHA1 SHA224 SHA256 SHA384 SHA512	3DES AES-128 AES-192 AES-256	3DES CBC AES-128 CBC AES-192 CBC AES-256 CBC	sect163k1 secp163r2 secp192r1
112	224-255	SHA1 SHA224 SHA256 SHA384 SHA512	3DES AES-128 AES-192 AES-256	3DES CBC AES-128 CBC AES-192 CBC AES-256 CBC	secp224r1 sect233k1 sect233r1
128	256-383	SHA1 SHA224 SHA256 SHA384 SHA512	AES-128 AES-192 AES-256	AES-128 CBC AES-192 CBC AES-256 CBC	secp256r1 sect283k1 sect283r1
192	384-511	SHA224 SHA256 SHA384 SHA512	AES-192 AES-256	AES-192 CBC AES-256 CBC	secp384r1 sect409k1 sect409r1

Internet-Draft

RFC 3278bis

June 2008

To promote interoperability, the following choices are RECOMMENDED:

Minimum Bits of Security	ECDH or ECQMV Key Size	Key Derivation Function	Key Wrap Alg.	Content Encryption Alg.	Curve
80	192	SHA256	3DES	3DES CBC	secp192r1
112	224	SHA256	3DES	3DES CBC	secp224r1
128	256	SHA256	AES-128	AES-128 CBC	secp256r1
192	384	SHA384	AES-256	AES-256 CBC	secp384r1
256	512	SHA512	AES-256	AES-256 CBC	secp521r1

When implementing SignedData, there are three algorithm related choices that need to be made:

- 1) What is the public key size?
- 2) What is the hash algorithm?
- 3) What is the curve?

Consideration must be given to the bits of security provided by each of these choices. Security is measured in bits, where a strong symmetric cipher with a key of X bits is said to provide X bits of security. It is recommended that the bits of security provided by each choice are roughly equivalent. The following table provides comparable minimum bits of security [[NISTSP800-57](#)] for the ECDSA key sizes and message digest algorithms. It also lists curves [[PKI-ALG](#)] for the key sizes.

RFC 3278bis

June 2008

## Acknowledgements

The methods described in this document are based on work done by the ANSI X9F1 working group. The authors wish to extend their thanks to ANSI X9F1 for their assistance. The authors also wish to thank Peter de Rooij for his patient assistance. The technical comments of Francois Rousseau were valuable contributions.

Many thanks go out to the other authors of [RFC 3278](#): Simon Blake-Wilson and Paul Lambert. Without the initial version of [RFC3278](#) this version wouldn't exist.

The authors also wish to thank Alfred Hoenes, Jim Schaad, and Russ

Housley for their valuable input.

This document is subject to the rights, licenses and restrictions contained in [BCP 78](#), and except as set forth therein, the authors retain all their rights.

This document and the information contained herein are provided on an "AS IS" basis and THE CONTRIBUTOR, THE ORGANIZATION HE/SHE REPRESENTS OR IS SPONSORED BY (IF ANY), THE INTERNET SOCIETY, THE IETF TRUST AND THE INTERNET ENGINEERING TASK FORCE DISCLAIM ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

## Intellectual Property

The IETF takes no position regarding the validity or scope of any Intellectual Property Rights or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; nor does it represent that it has made any independent effort to identify any such rights. Information on the procedures with respect to rights in RFC documents can be found in [BCP 78](#) and [BCP 79](#).

Copies of IPR disclosures made to the IETF Secretariat and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF on-line IPR repository at <http://www.ietf.org/ipr>.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights that may cover technology that may be required to implement this standard. Please address the information to the IETF at [ietf-ipr@ietf.org](mailto:ietf-ipr@ietf.org).
