DS-Lite Management Information Base (MIB) for AFTRs
draft-ietf-softwire-dslite-mib-15

Abstract

This memo defines a portion of the Management Information Base (MIB) for using with network management protocols in the Internet community. In particular, it defines managed objects for Address Family Transition Routers (AFTRs) of Dual-Stack Lite (DS-Lite).

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on July 6, 2016.

[1.](#) Introduction

Dual-Stack Lite [[RFC6333](#)] is a solution to offer both IPv4 and IPv6 connectivity to customers crossing an IPv6 only infrastructure. One of its key components is an IPv4-over-IPv6 tunnel, which is used to provide IPv4 connectivity across a service provider's IPv6 network. Another key component is a carrier-grade IPv4-IPv4 Network Address Translation (NAT) to share service provider IPv4 addresses among customers.

This document defines a portion of the Management Information Base (MIB) for using with network management protocols in the Internet community. This MIB module may be used for configuration and monitoring Address Family Transition Routers (AFTRs) in a Dual-Stack Lite scenario.

2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [\[RFC2119\]](#) when they appear in ALL CAPS. When these words are not in ALL CAPS (such as "should" or "Should"), they have their usual English meanings, and are not to be interpreted as [\[RFC2119\]](#) key words.

3. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to [section 7 of \[RFC3410\]](#).

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in [\[RFC2578\]](#), [\[RFC2579\]](#) and [\[RFC2580\]](#).

4. Relationship to the IF-MIB

The Interfaces MIB [\[RFC2863\]](#) defines generic managed objects for managing interfaces. Each logical interface (physical or virtual) has an ifEntry. Tunnels are handled by creating a logical interface (ifEntry) for each tunnel. Each DS-Lite tunnel endpoint also acts as a virtual interface, which has a corresponding entry in the IP Tunnel MIB and Interface MIB. Those corresponding entries are indexed by ifIndex.

The ifOperStatus in ifTable is used to represent whether the DS-Lite tunnel function has been triggered. The ifInUcastPkts defined in ifTable will represent the number of IPv4 packets that have been encapsulated into IPv6 packets sent to a B4. The ifOutUcastPkts defined in ifTable contains the number of IPv6 packets that can be decapsulated to IPv4 in the virtual interface. Also, the IF-MIB defines ifMtu for the MTU of this tunnel interface, so DS-Lite MIB does not need to define the MTU for the tunnel.

5. Difference from the IP tunnel MIB and NATV2-MIB

The key technologies for DS-Lite are IP in IP (IPv4-in-IPv6) tunnels and NAT (IPv4 to IPv4 translation).

Notes: According to [section 5.2 of \[RFC6333\]](#), DS-Lite only defines IPv4 in IPv6 tunnels at this moment, but other types of encapsulation could be defined in the future. So this DS-Lite MIB only supports IP in IP encapsulation. If another RFC defines other tunnel types in the future, this DS-Lite MIB will be updated then.

The NATV2-MIB [[RFC7659](#)] is designed to carry translation from any address family to any address family, therefore it supports IPv4 to IPv4 translation.

The IP Tunnel MIB [[RFC4087](#)] is designed for managing tunnels of any type over IPv4 and IPv6 networks, therefore it has already supports IP in IP tunnels. But in a DS-Lite scenario, the tunnel type is point-to-multipoint IP in IP tunnels. The direct(2) defined in IP Tunnel MIB only supports point-to-point tunnel. So it needs to define a new tunnel type for DS-Lite.

However, the NATV2-MIB and IP Tunnel MIB together are not sufficient to support DS-Lite. This document describes the specific features for DS-Lite MIB, as below.

In the DS-Lite scenario, the Address Family Transition Router (AFTR) is not only the tunnel end concentrator, but also an IPv4-to-IPv6 NAT. So as defined in [[RFC6333](#)], when the IPv4 packets come back from the Internet to the AFTR, it knows how to reconstruct the IPv6 encapsulation by doing a reverse lookup in the extended IPv4 NAT binding table ([section 6.6 of \[RFC6333\]](#)). The NAT binding table in the AFTR is extended to include the IPv6 address of the tunnel initiator. However, the NAT binding information defined in NATV2-MIB as natv2PortMapTable is indexed by the NAT instance, protocol, and external realm and address. Because the tunnelIfTable defined in the TUNNEL-MIB [[RFC4087](#)] is indexed by the ifIndex, the DS-Lite-MIB needs to define the tunnel objects to extend the NAT binding entry by interface. Therefore, a combined MIB is necessary.

An implementation of the IP Tunnel MIB is required for DS-Lite. As the tunnel is not point-to-point in DS-Lite, it needs to define a new tunnel type for DS-Lite. And the tunnelIfEncapsMethod in the tunnelIfEntry should be set to dsLite ("xx"), and a corresponding entry in the DS-Lite module will exist for every tunnelIfEntry with this tunnelIfEncapsMethod. The tunnelIfRemoteInetAddress must be set to "::".

6. Structure of the MIB Module

The DS-Lite MIB provides a way to monitor and manage the devices (AFTRs) in a DS-Lite scenario through SNMP.

The DS-Lite MIB is configurable on a per-interface basis. It depends on several parts of the IF-MIB [[RFC2863](#)], IP Tunnel MIB [[RFC4087](#)], and NATV2-MIB [[RFC7659](#)].

[6.1.](#) The Object Group

This group defines objects that are needed for DS-Lite MIB.

[6.1.1.](#) The dsliteTunnel Subtree

The dsliteTunnel subtree describes managed objects used for managing tunnels in the DS-Lite scenario. Because the tunnelInetConfigLocalAddress and tunnelInetConfigRemoteAddress defined in the IP Tunnel MIB are not readable, a few new objects are defined in DS-Lite MIB.

[6.1.2.](#) The dsliteNAT Subtree

The dsliteNAT subtree describes managed objects used for configuration as well as monitoring of an AFTR which is capable of a NAT function. Because the NATV2-MIB supports the NAT management function in DS-Lite, we may reuse it in DS-Lite MIB. The dsliteNAT subtree also provides the mapping information between the tunnel entry (dsliteTunnelEntry) and the NAT entry (dsliteNATBindEntry) by adding the IPv6 address of the B4 to the natv2PortMapEntry in the NATV2-MIB.

[6.1.3.](#) The dsliteInfo Subtree

The dsliteInfo subtree provides statistical information for DS-Lite.

[6.2.](#) The Notification Group

This group defines some notification objects for a DS-Lite scenario.

[6.3.](#) The Conformance Group

The dsliteConformance subtree provides conformance information of MIB objects.

[7.](#) MIB modules required for IMPORTS

This MIB module IMPORTs objects from [[RFC2578](#)], [[RFC2580](#)], [[RFC2863](#)], [[RFC3411](#)], [[RFC4001](#)] and [[RFC7659](#)].

END
```

9. Security Considerations

There are three objects defined in this MIB module with a MAX-ACCESS clause of read-write. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection opens devices to attack. These are the tables and objects and their sensitivity/vulnerability:

Notification thresholds: An attacker setting an arbitrarily low threshold can cause many useless notifications to be generated. Setting an arbitrarily high threshold can effectively disable notifications, which could be used to hide another attack.

dsliteAFTRAlarmConnectNumber

dsliteAFTRAlarmSessionNumber

dsliteAFTRAlarmPortNumber

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

Objects that reveal host identities: Various objects can reveal the identity of private hosts that are engaged in a session with external end nodes. A curious outsider could monitor these to assess the number of private hosts being supported by the AFTR device. Further, a disgruntled former employee of an enterprise could use the information to break into specific private hosts by intercepting the existing sessions or originating new sessions into the host. If nothing else, unauthorized monitoring of these objects will violate individual subscribers' privacy.

entries in dsliteTunnelTable

entries in dsliteNATBindTable

Unauthorized read access to the dsliteTunnelTable would reveal information about the tunnel topology.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPSec), there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

Implementations SHOULD provide the security features described by the SNMPv3 framework (see [[RFC3410](#)]), and implementations claiming compliance to the SNMPv3 standard MUST include full support for authentication and privacy via the User-based Security Model (USM) [[RFC3414](#)] with the AES cipher algorithm [[RFC3826](#)]. Implementations MAY also provide support for the Transport Security Model (TSM) [[RFC5591](#)] in combination with a secure transport such as SSH [[RFC5592](#)] or TLS/DTLS [[RFC6353](#)].

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

10. IANA Considerations

The MIB module in this document uses the following IANA-assigned OBJECT IDENTIFIER value recorded in the SMI Numbers registry, and the following IANA-assigned tunnelType value recorded in the IANAtunnelType-MIB registry:

Descriptor	OBJECT IDENTIFIER value
-----	-----
DSLite-MIB	{ mib-2 XXX }

IANAtunnelType ::= TEXTUAL-CONVENTION

SYNTAX INTEGER {

 dsLite ("XX") -- dslite tunnel

 }

11. Acknowledgements

The authors would like to thanks the valuable comments made by Suresh Krishnan, Ian Farrer, Yiu Lee, Qi Sun, Yong Cui, David Harrington, Dave Thaler, Tassos Chatzithomaoglou, Tom Taylor, Hui Deng, Carlos Pignataro, Matt Miller, Terry Manderson and other members of The SOFTWARE WG.

This document was produced using the xml2rfc tool [[RFC2629](#)].
