A Yang Data Model for VN Operation
draft-ietf-teas-actn-vn-yang-08

Abstract

This document provides a YANG data model generally applicable to any mode of Virtual Network (VN) operation.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 9, 2020.

Table of Contents

1. Introduction

This document provides a YANG data model generally applicable to any mode of Virtual Network (VN) operation.

The VN model defined in this document is applicable in generic sense as an independent model in and of itself. The VN model defined in this document can also work together with other customer service

models such as L3SM [RFC8299], L2SM [RFC8466] and L1CSM [I-D.ietf-ccamp-l1csm-yang] to provide a complete life-cycle service management and operations.

The YANG model discussed in this document basically provides the following:

- Characteristics of Access Points (APs) that describe customer's end point characteristics;
- Characteristics of Virtual Network Access Points (VNAP) that describe How an AP is partitioned for multiple VNs sharing the AP and its reference to a Link Termination Point (LTP) of the Provider Edge (PE) Node;
- Characteristics of Virtual Networks (VNs) that describe the customer's VNs in terms of VN Members comprising a VN, multi-source and/or multi-destination characteristics of VN Member, the VN's reference to TE-topology's Abstract Node;

The actual VN instantiation and computation is performed with Connectivity Matrices sub-module of TE-Topology Model [I-D.ietf-teas-yang-te-topo] which provides TE network topology abstraction and management operation. Once TE-topology Model is used in triggering VN instantiation over the networks, TE-tunnel [I-D.ietf-teas-yang-te] Model will inevitably interact with TE-Topology model for setting up actual tunnels and LSPs under the tunnels.

Abstraction and Control of Traffic Engineered Networks (ACTN) describes a set of management and control functions used to operate one or more TE networks to construct virtual networks that can be represented to customers and that are built from abstractions of the underlying TE networks [RFC8453]. ACTN is the primary example of the usage of the VN Yang model.

Sections 2 and 3 provide the discussion of how the VN Yang model is applicable to the ACTN context where Virtual Network Service (VNS) operation is implemented for the Customer Network Controller (CNC)-Multi-Domain Service Coordinator (MSDC) interface (CMI).

The YANG model on the CMI is also known as customer service model in [RFC8309]. The YANG model discussed in this document is used to operate customer-driven VNs during the VN instantiation, VN computation, and its life-cycle service management and operations.

The VN operational state is included in the same tree as the configuration consistent with Network Management Datastore

Architecture (NMDA) [RFC8342]. The origin of the data is indicated as per the origin metadata annotation.

1.1. Terminology

Refer to [RFC8453], [RFC7926], and [RFC8309] for the key terms used in this document.

1.2. Tree diagram

A simplified graphical representation of the data model is used in Section 5 of this this document. The meaning of the symbols in these diagrams is defined in [RFC8340].

1.3. Prefixes in Data Node Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in Table 1.

Prefix	YANG module	Reference
vn	ietf-vn	[RFCXXXX]
nw	ietf-network	[RFC8345]
nt	ietf-network-topology	[RFC8345]
te-types	ietf-te-types	[I-D.ietf-teas-yang-te]
te-topo	ietf-te-topology	[I-D.ietf-teas-yang-te-topo]

Table 1: Prefixes and corresponding YANG modules

Note: The RFC Editor will replace XXXX with the number assigned to the RFC once this draft becomes an RFC.

2. Use-case of VN Yang Model in the ACTN context

In this section, ACTN is being used to illustrate the general usage of the VN yang model. The model presented in this section has the following ACTN context.

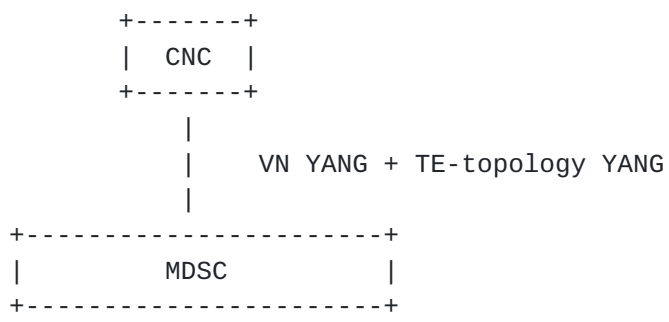

Figure 1: ACTN CMI

Both ACTN VN YANG and TE-topology models are used over the CMI to establish a VN over TE networks.

In the context of 5G transport application, 5G Traffic Provisioning Manager (TPM) that provides slicing requirements to the transport networks (i.e., MDSC) can be considered as a type of CNC. The ACTN CMI provides the necessary interface functions between 5G and transport networks in order to facilitate dynamic VN creation and its lifecycle management with proper feedback loop for monitoring.

2.1. Type 1 VN

As defined in [RFC8453], a Virtual Network is a customer view of the TE network. To recapitulate VN types from [RFC8453], Type 1 VN is defined as follows:

The VN can be seen as a set of edge-to-edge abstract links (a Type 1 VN). Each abstract link is referred to as a VN member and is formed as an end-to-end tunnel across the underlying networks. Such tunnels may be constructed by recursive slicing or abstraction of paths in the underlying networks and can encompass edge points of the customer's network, access links, intra-domain paths, and inter-domain links.

If we were to create a VN where we have four VN-members as follows:

VN-Member 1 L1-L4
VN-Member 2 L1-L7
VN-Member 3 L2-L4
VN-Member 4 L3-L8

Where L1, L2, L3, L4, L7 and L8 correspond to a Customer End-Point, respectively.

This VN can be modeled as one abstract node representation as follows in Figure 2:

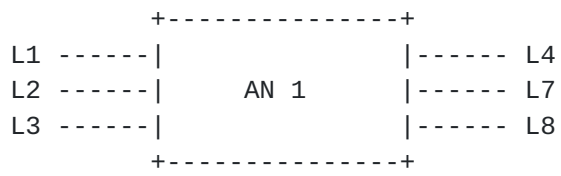

Figure 2: Abstract Node (One node topology)

Modeling a VN as one abstract node is the easiest way for customers to express their end-to-end connectivity; however, customers are not limited to express their VN only with one abstract node.

2.2. Type 2 VN

For some VN members of a VN, the customers are allowed to configure the actual path (i.e., detailed virtual nodes and virtual links) over the VN/abstract topology agreed mutually between CNC and MDSC prior to or a topology created by the MDSC as part of VN instantiation. Type 1 VN is a higher abstraction of a Type 2 VN.

If a Type 2 VN is desired for some or all of VN members of a type 1 VN (see the example in Section 2.1), the TE-topology model can provide the following abstract topology (that consists of virtual nodes and virtual links) which is built under the Type 1 VN.

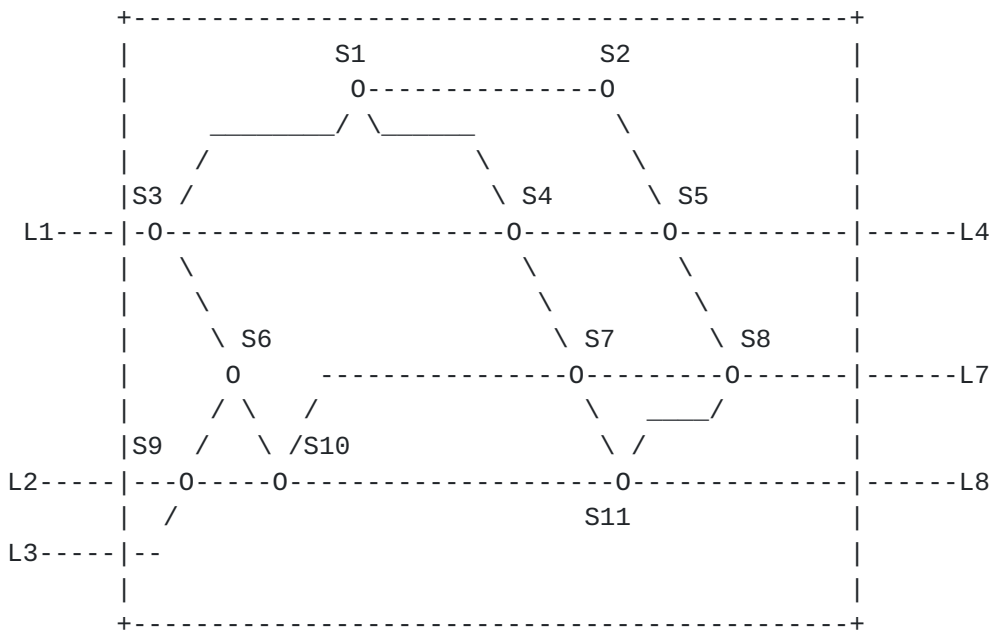

Figure 3: Type 2 topology

As you see from Figure 3, the Type 1 abstract node is depicted as a Type 1 abstract topology comprising of detailed virtual nodes and virtual links.

As an example, if VN-member 1 (L1-L4) is chosen to configure its own path over Type 2 topology, it can select, say, a path that consists of the ERO {S3,S4,S5} based on the topology and its service requirement. This capability is enacted via TE-topology configuration by the customer.

3. High-Level Control Flows with Examples

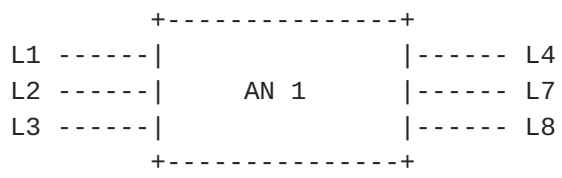
3.1. Type 1 VN Illustration

If we were to create a VN where we have four VN-members as follows:

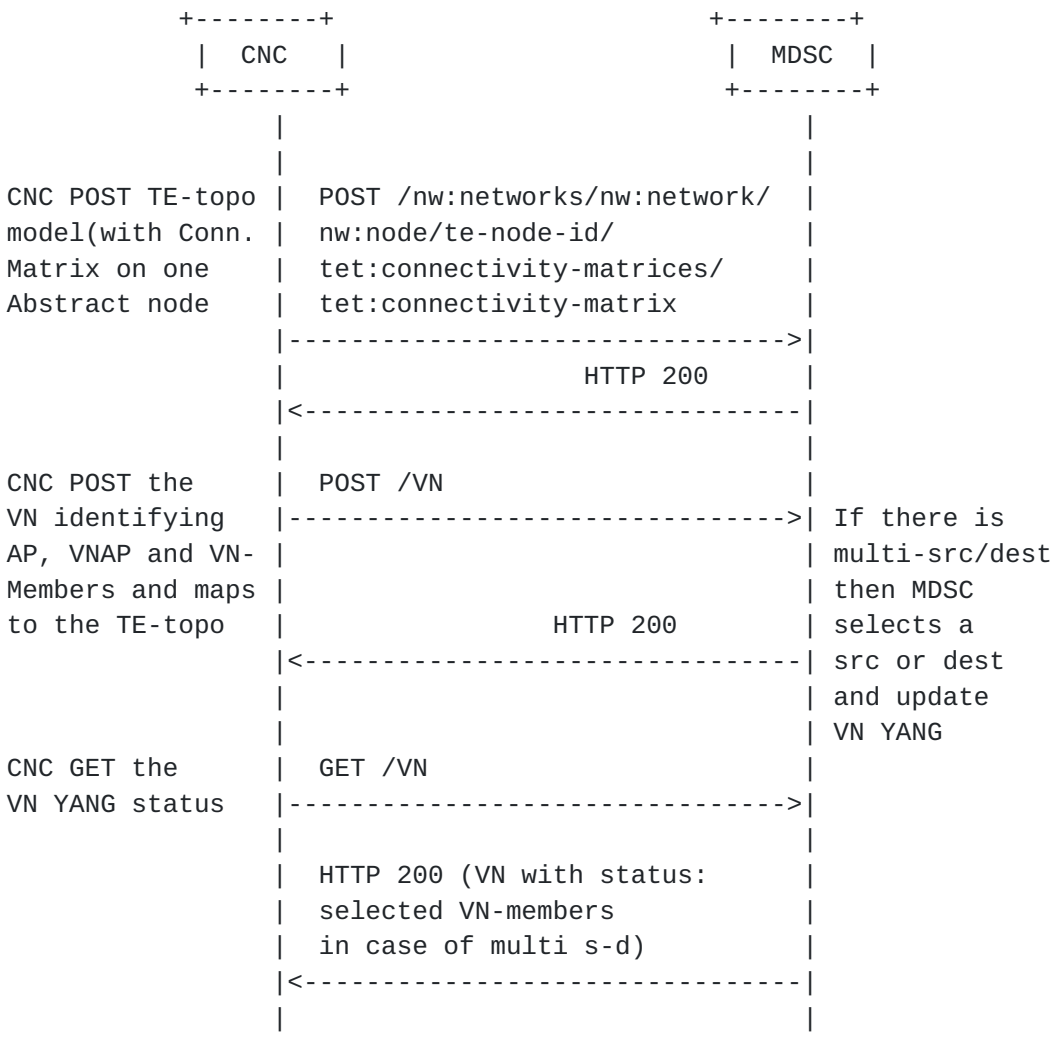
VN-Member 1	L1-L4
VN-Member 2	L1-L7
VN-Member 3	L2-L4
VN-Member 4	L3-L8

Where L1, L2, L3, L4, L7 and L8 correspond to Access Points.

This VN can be modeled as one abstract node representation as follows:



If this VN is Type 1, the following diagram shows the message flow between CNC and MDSC to instantiate this VN using VN and TE-Topology Models.



3.2. Type 2 VN Illustration

For some VN members, the customer may want to "configure" explicit routes over the path that connects its two end-points. Let us consider the following example.

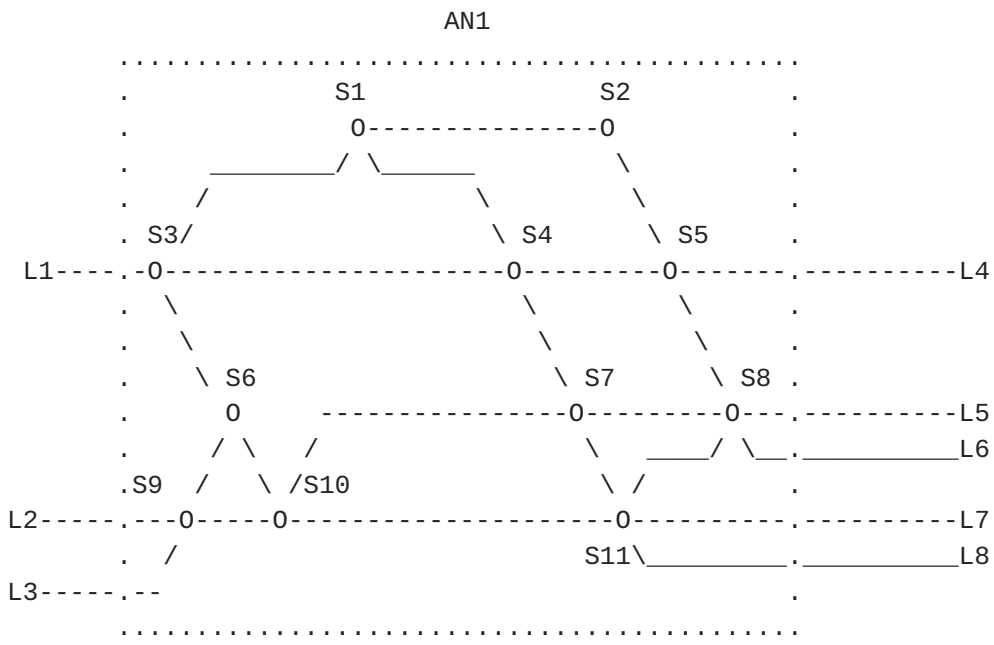
VN-Member 1 L1-L4 (via S3, S4, and S5)

VN-Member 2 L1-L7 (via S3, S4, S7 and S8)

VN-Member 3 L2-L7 (via S9, S10, and S11)

VN-Member 4 L3-L8 (via S9, S10 and S11)

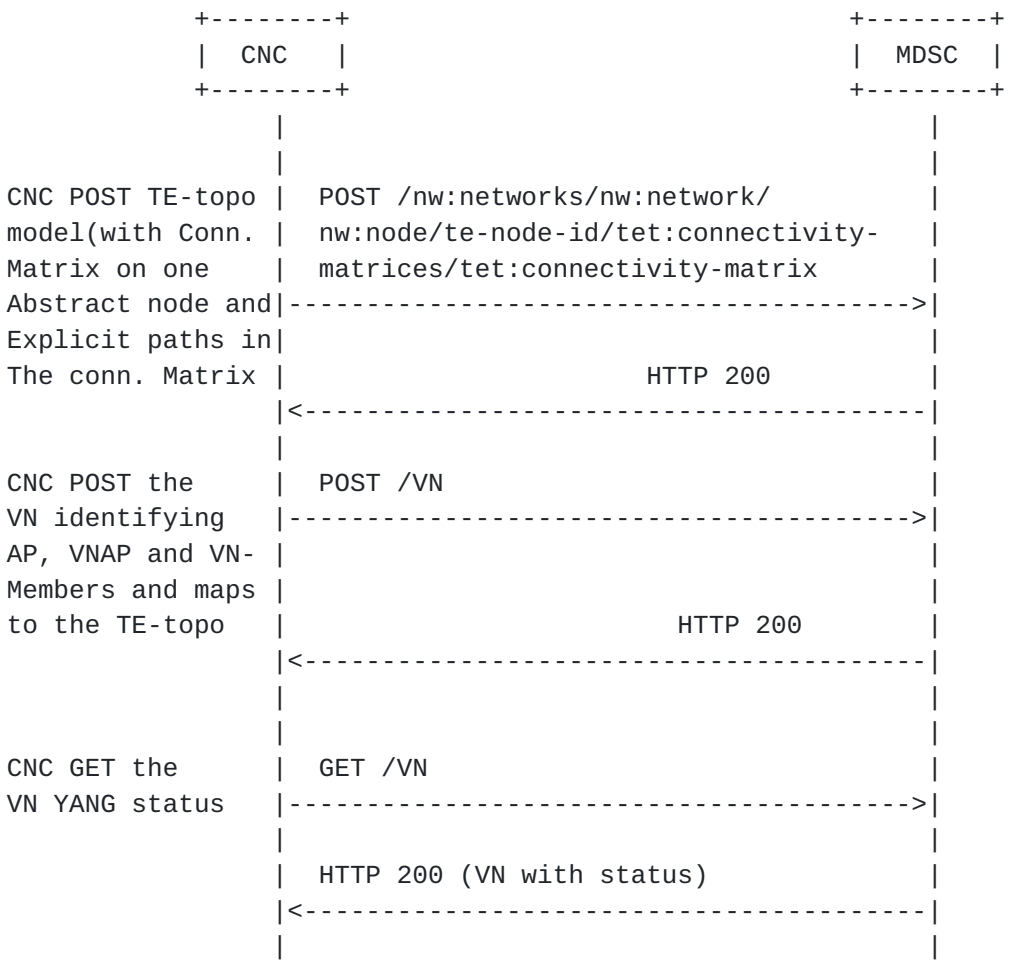
Where the following topology is the underlay for Abstraction Node 1 (AN1).



There are two options depending on whether CNC or MDSC creates the single abstract node topology.

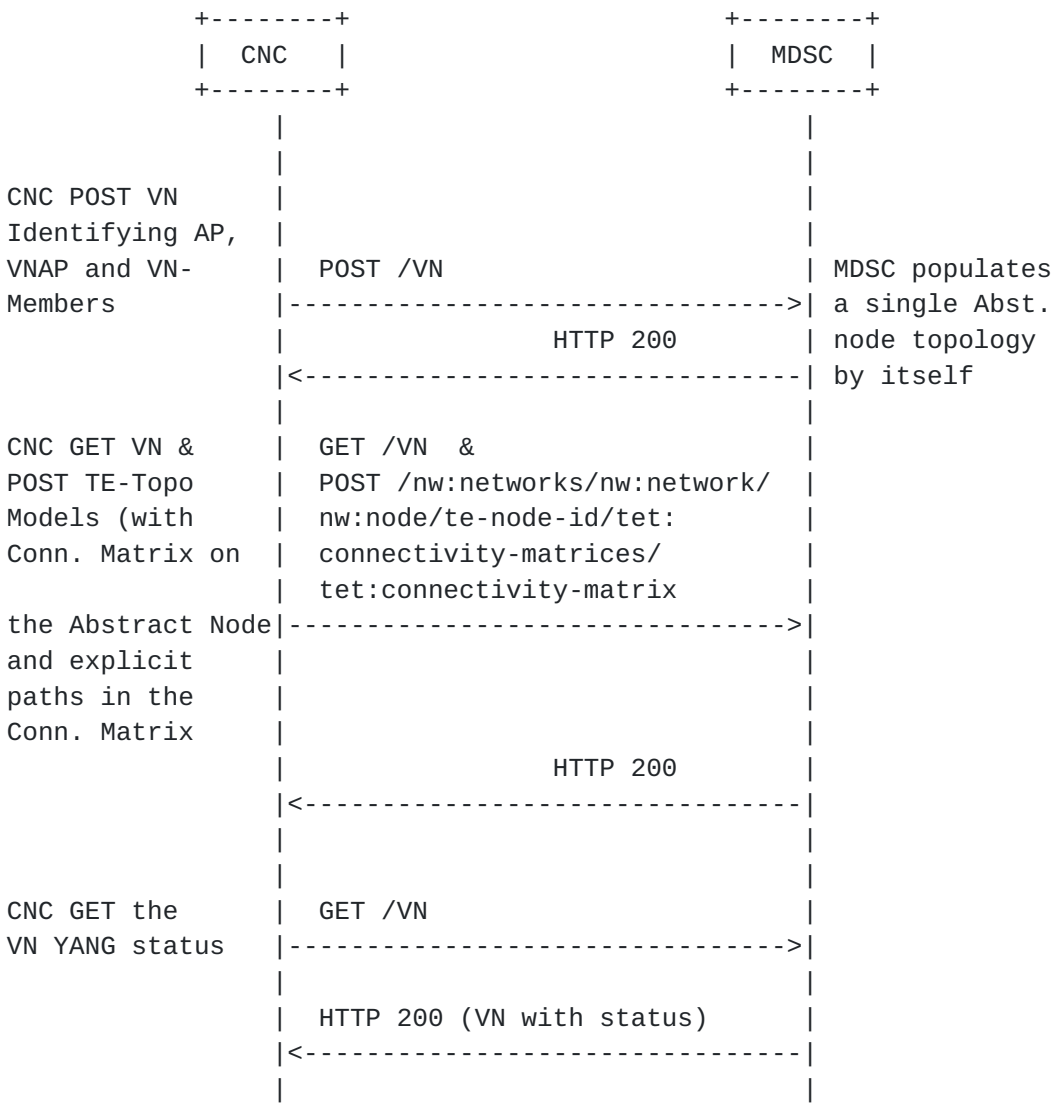
Case 1:

If CNC creates the single abstract node topology, the following diagram shows the message flow between CNC and MDSC to instantiate this VN using VN and TE-Topology Model.



Case 2:

On the other hand, if MDSC create the single abstract node topology based VN YANG posted by the CNC, the following diagram shows the message flow between CNC and MDSC to instantiate this VN using VN and TE-Topology Models.



Section 7 provides JSON examples for both VN model and TE-topology Connectivity Matrix sub-model to illustrate how a VN can be created by the CNC making use of the VN module as well as the TE-topology Connectivity Matrix module.

3.2.1. VN and AP Usage

The customer access information may be known at the time of VN creation. A shared logical AP identifier is used between the customer and the operator to identify the access link between Customer Edge (CE) and Provider Edge (PE) . This is described in Section 6 of [RFC8453].

In some VN operations, the customer access may not be known at the initial VN creation. The VN operation allow a creation of VN with

only PE identifier as well. The customer access information could be added later.

To achieve this the 'ap' container has a leaf for 'pe' node that allows AP to be created with PE information. The vn-member (and vn) could use APs that only have PE information initially.

4. VN Model Usage

4.1. Customer view of VN

The VN-Yang model allows to define a customer view, and allows the customer to communicate using the VN constructs as described in the [RFC8454]. It also allows to group the set of edge-to-edge links (i.e., VN members) under a common umbrella of VN. This allows the customer to instantiate and view the VN as one entity, making it easier for some customers to work on VN without worrying about the details of the provider based YANG models.

This is similar to the benefits of having a separate YANG model for the customer services as described in [RFC8309], which states that service models do not make any assumption of how a service is actually engineered and delivered for a customer.

4.2. Auto-creation of VN by MDSC

The VN could be configured at the MDSC explicitly by the CNC using the VN yang model. In some other cases, the VN is not explicitly configured, but created automatically by the MDSC based on the customer service model and local policy, even in these case the VN yang model can be used by the CNC to learn details of the underlying VN created to meet the requirements of customer service model.

4.3. Innovative Services

4.3.1. VN Compute

VN Model supports VN compute (pre-instantiation mode) to view the full VN as a single entity before instantiation. Achieving this via path computation or "compute only" tunnel setup does not provide the same functionality.

4.3.2. Multi-sources and Multi-destinations

In creating a virtual network, the list of sources or destinations or both may not be pre-determined by the customer. For instance, for a given source, there may be a list of multiple-destinations to which the optimal destination may be chosen depending on the network

resource situations. Likewise, for a given destination, there may also be multiple-sources from which the optimal source may be chosen. In some cases, there may be a pool of multiple sources and destinations from which the optimal source-destination may be chosen. The following YANG module is shown for describing source container and destination container. The following YANG tree shows how to model multi-sources and multi-destinations.

```
  +--rw vn

        +--rw vn-level-diversity?   vn-disjointness
```

4.3.3. Others

The VN Yang model can be easily augmented to support the mapping of VN to the Services such as L3SM and L2SM as described in [I-D.ietf-teas-te-service-mapping-yang].

The VN Yang model can be extended to support telemetry, performance monitoring and network autonomics as described in [I-D.ietf-teas-actn-pm-telemetry-autonomics].

4.3.4. Summary

This section summarizes the innovative service features of the VN Yang.

- Maintenance of AP and VNAP along with VN
- VN construct to group of edge-to-edge links
- VN Compute (pre-instantiate)
- Multi-Source / Multi-Destination
- Ability to support various VN and VNS Types
  - VN Type 1: Customer configures the VN as a set of VN Members. No other details need to be set by customer, making for a simplified operations for the customer.
  - VN Type 2: Along with VN Members, the customer could also provide an abstract topology, this topology is provided by the Abstract TE Topology Yang Model.

5. VN YANG Model (Tree Structure)

```

7. JSON Example

This section provides json implementation examples as to how VN YANG model and TE topology model are used together to instantiate virtual networks.

The example in this section includes following VN

- VN1 (Type 1): Which maps to the single node topology abstract1 (node D1) and consist of VN Members 104 (L1 to L4), 107 (L1 to L7), 204 (L2 to L4), 308 (L3 to L8) and 108 (L1 to L8). We also show how disjointness (node, link, srlg) is supported in the example on the global level (i.e., connectivity matrices level).

- VN2 (Type 2): Which maps to the single node topology abstract2 (node D2), this topology has an underlay topology (absolute) (see figure in section 3.2). This VN has a single VN member 105 (L1 to L5) and an underlay path (S4 and S7) has been set in the connectivity matrix of abstract2 topology;

- VN3 (Type 1): This VN has a multi-source, multi-destination feature enable for VN Member 104 (L1 to L4)/107 (L1 to L7) {multi-src} and VN Member 204 (L2 to L4)/304 (L3 to L4) {multi-dest} usecase. The selected VN-member is known via the field "if-selected" and the corresponding connectivity-matrix-id.

Note that the VN YANG model also include the AP and VNAP which shows various VN using the same AP.

```

8. Security Considerations

The configuration, state, and action data defined in this document are designed to be accessed via a management protocol with a secure transport layer, such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH)

[RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The NETCONF access control model [RFC8341] provides the means to restrict access for particular NETCONF users to a preconfigured subset of all available NETCONF protocol operations and content.

The model presented in this document is used in the interface between the Customer Network Controller (CNC) and Multi-Domain Service Coordinator (MDSC), which is referred to as CNC-MDSC Interface (CMI). Therefore, many security risks such as malicious attack and rogue elements attempting to connect to various ACTN components. Furthermore, some ACTN components (e.g., MSDC) represent a single point of failure and threat vector and must also manage policy conflicts and eavesdropping of communication between different ACTN components.

A number of configuration data nodes defined in this document are writable/deletable (i.e., "config true") These data nodes may be considered sensitive or vulnerable in some network environments.

These are the subtrees and data nodes and their sensitivity/ vulnerability:

- access-point-list:
  - access-point-id
  - max-bandwidth
  - avl-bandwidth
- vn-ap:
  - vn-ap-id
  - vn
  - abstract-node
  - ltp
- vn-list
  - vn-id
  - vn-topology-id

    * abstract-node

  o vn-member-id

    * src

    * src-vn-ap-id

    * dest

    * dest-vn-ap-id

    * connectivity-matrix-id

9. IANA Considerations

This document registers the following namespace URIs in the IETF XML registry [RFC3688]:

```
---------------------------------------------------------------------
URI: urn:ietf:params:xml:ns:yang:ietf-vn
Registrant Contact: The IESG.
XML: N/A, the requested URI is an XML namespace.
---------------------------------------------------------------------
```

This document registers the following YANG modules in the YANG Module Names registry [RFC6020]:

```
---------------------------------------------------------------------
name:         ietf-vn
namespace:    urn:ietf:params:xml:ns:yang:ietf-vn
prefix:       vn
reference:    RFC XXXX (TDB)
---------------------------------------------------------------------
```

10. Acknowledgments

The authors would like to thank Xufeng Liu and Adrian Farrel for their helpful comments and valuable suggestions.
