YANG Data Model for Layer 3 TE Topologies
[draft-ietf-teas-yang-l3-te-topo-10](#)

Abstract

This document defines a YANG data model for layer 3 traffic engineering topologies.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on August 26, 2021.

[1. Introduction](#)

This document defines a YANG [[RFC7950](#)] data model for describing the relationship between a layer 3 unicast topology [[RFC8346](#)] and a Traffic Engineering (TE) topology [[RFC8795](#)].

When traffic engineering is enabled on a layer 3 unicast topology, there will be a corresponding TE topology. The TE topology may or may not be congruent with the layer 3 unicast topology. When such a congruent TE topology exists, there will be a one-to-one association between the one modeling element in the layer 3 unicast topology and another element in the TE topology. When such a congruent TE topology does not exist, the association will not be one-to-one. This YANG data model supports both cases.

[1.1. Terminology](#)

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#), [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

The following terms are defined in [[RFC7950](#)] and are not redefined here:

- o augment
- o data model
- o data node

[1.2. Tree Diagrams](#)

Tree diagrams used in this document follow the notation defined in [[RFC8340](#)].

[2. Modeling Considerations for L3 TE Topologies](#)

A layer 3 TE topology is a layer 3 unicast topology with additional TE capabilities enabled. [[RFC8346](#)] defines a YANG data model for layer 3 unicast topologies, consisting of two modules: ietf-l3-unicast-topology and ietf-l3-unicast-topology-state. The YANG data model defined in this document augments the YANG data model defined

in [[RFC8346](#)]. This document specifies two YANG modules `ietf-l3-te-topology` and `ietf-l3-te-topology-state`, augmenting `ietf-l3-unicast-topology` and `ietf-l3-unicast-topology-state` respectively, to add additional TE capabilities. Such an augmentation relationship is shown in Figure 1 below.

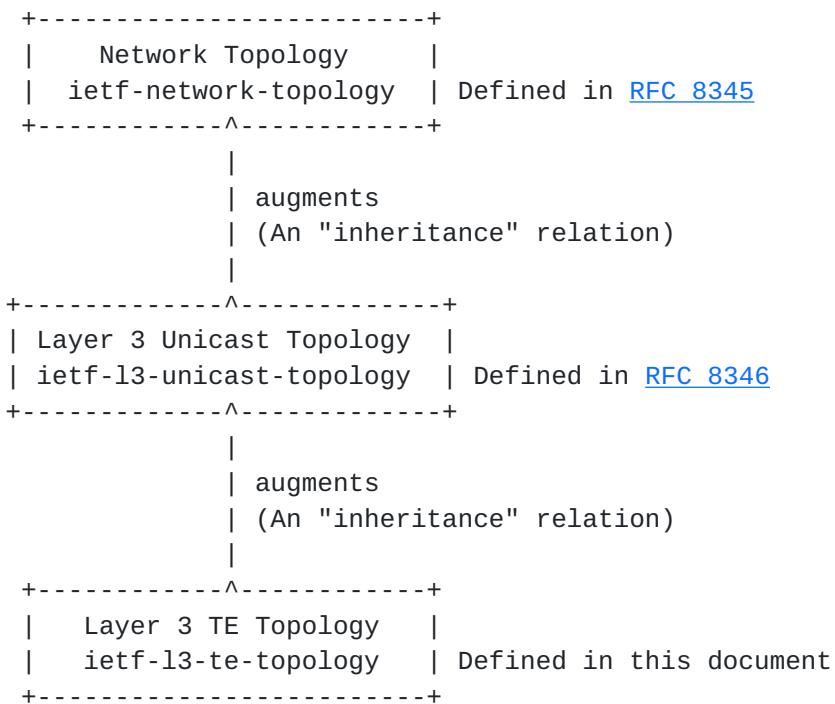

Figure 1: L3 TE Model Augmentation

Additionally, this document specifies two more YANG modules `ietf-te-topology-packet` and `ietf-te-topology-packet-state`, augmenting `ietf-te-topology` and `ietf-te-topology-state` respectively, to add additional attributes for packet data networks, as shown in Figure 2. [Section 3](#) of this document describes these additional attributes in further details.

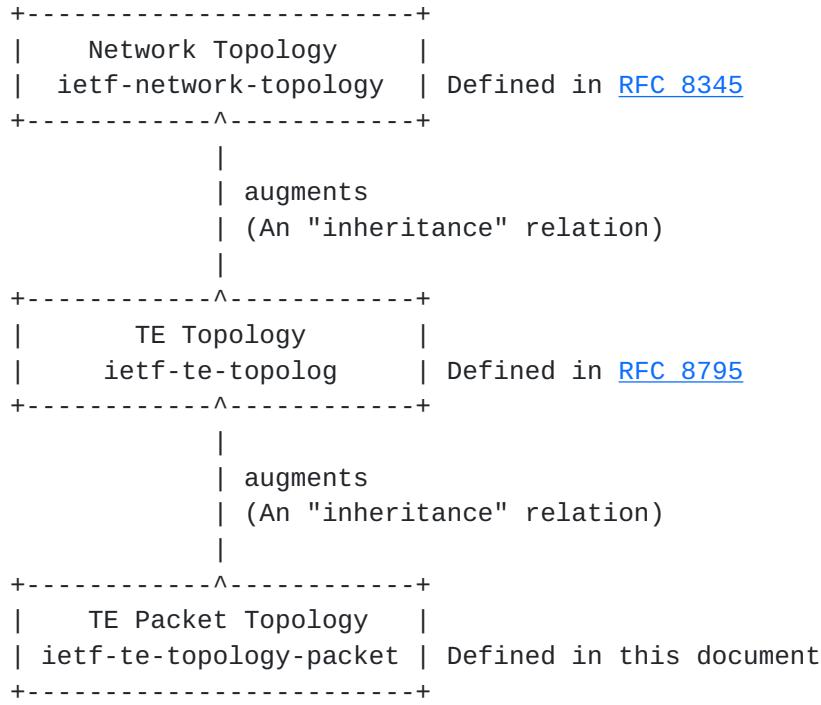

Figure 2: TE Packet Model Augmentation

[2.1.](#) Relationship Between Layer 3 Unicast Topology and TE topology

In general, the layer 3 unicast topology model specified in [[RFC8346](#)] and the TE topology model specified in [[RFC8795](#)] can be used independently. This document provides a method to use both together.

When traffic engineering is enabled on a layer 3 unicast topology, there will be a resulting layer 3 TE topology, which is modeled by the YANG modules defined in this document. A layer 3 TE topology augments a layer 3 unicast topology, so it inherits all the objects and properties of the base layer 3 unicast topology. In addition, in such a layer 3 TE topology, the objects that are inherited from the base layer 3 unicast topology to this layer 3 TE topology may be associated with the objects in one corresponding TE topology. Such associations are supported by the module `ietf-l3-te-topology` defined in this document.

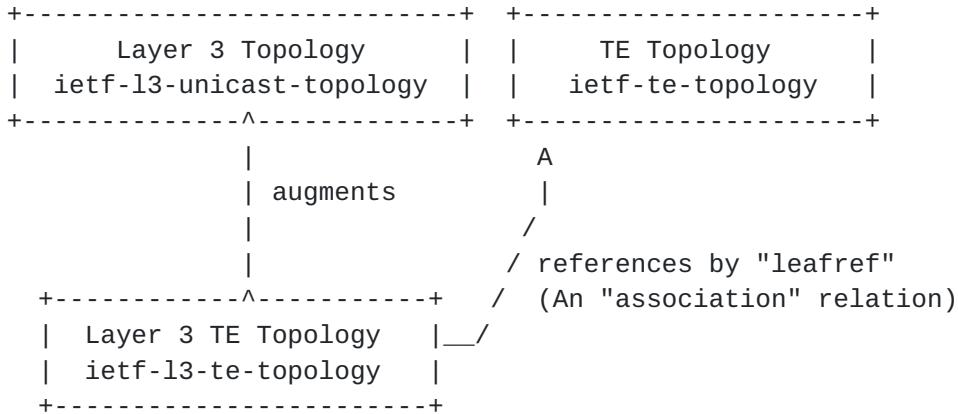

Figure 3: Model References

The properties of the relations between the objects in a layer 3 TE topology and the objects in the corresponding TE topology are:

- o The associations are between objects of the same class, i.e. node to node or link to link.
- o The multiplicity of such an association is: 0..1 to 0..1. An object in a layer 3 TE topology modeled by ietf-l3-te-topology may be associated with zero or one object in the corresponding TE topology.

[2.2.](#) Relationship Modeling

YANG data type leafref is used to model the association relationship between a layer 3 TE topology and a TE topology. YANG "must" statements are used to enforce that the referenced objects are in a topology of the proper type.

[2.2.1.](#) Topology Referencing

When TE is enabled on a layer 3 unicast topology, if the TE topology is not congruent with the layer 3 unicast topology, the layer 3 TE topology will have a reference to the corresponding TE topology. Such a reference is modeled as follows:

```
augment /nw:networks/nw:network/l3t:l3-topology-attributes:
  +-rw l3-te-topology-attributes
    +-rw network-ref? -> /nw:networks/network/network-id
```

The above network-ref is a YANG data node of type leafref, used to indicate the network-id of the corresponding TE topology. The

leafref relationship is illustrated by the simplified data instances in the following diagram.

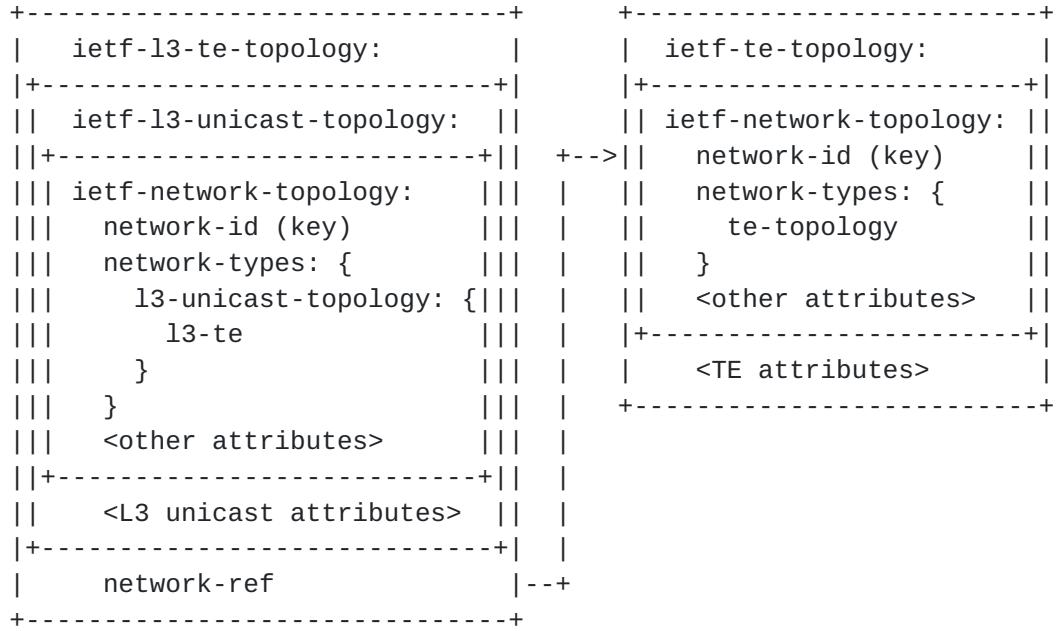

Figure 4: Topology Referencing

network-id defined in [\[RFC8345\]](#) uniquely identifies a network topology instance of any type. As shown in the above diagram, the value of network-ref in the ietf-13-te-topology instance matches the value of network-id in the ietf-te-topology instance. To ensure that the topology instance identified by this network-id is of type "te-topology", a "must" statement is defined in module ietf-13-te-topology. Such "must" statements are also used in all the following leafref nodes in this section.

If the TE topology is congruent with the layer 3 unicast topology, the above reference can still be used to specified TE parameters defined in the TE topology model.

2.2.2. Node Referencing

When TE is enabled on a layer 3 unicast topology, if the TE topology is not congruent with the layer 3 unicast topology, a node in the layer 3 TE topology may have a reference to the corresponding node in the TE Topology. Such a reference is modeled as follows:

```

augment /nw:networks/nw:network/nw:node/l3t:l3-node-attributes:
  +-rw l3-te-node-attributes
    +-rw node-ref?      leafref
    +-rw network-ref?   -> /nw:networks/network/network-id

```

2.2.3. Link Termination Point Referencing

When TE is enabled on a layer 3 unicast topology, if the TE topology is not congruent with the layer 3 unicast topology, a link termination point in the layer 3 TE topology may have a reference to the corresponding link termination point in the TE Topology. Such a reference is modeled as follows:

```

augment /nw:networks/nw:network/nw:node/nt:termination-point
  /l3t:l3-termination-point-attributes:
    +-rw l3-te-tp-attributes
      +-rw tp-ref?      leafref
      +-rw node-ref?    leafref
      +-rw network-ref?  -> /nw:networks/network/network-id

```

2.2.4. Link Referencing

When TE is enabled on a layer 3 unicast topology, if the TE topology is not congruent with the layer 3 unicast topology, a link in the layer 3 topology may have a reference to the corresponding link in the TE Topology. Such a reference is modeled as follows:

```

augment /nw:networks/nw:network/nt:link/l3t:l3-link-attributes:
  +-rw l3-te-link-attributes
    +-rw link-ref?      leafref
    +-rw network-ref?   -> /nw:networks/network/network-id

```

2.3. Topology Type Modeling

A new topology type is defined in this document, to indicate a topology that is a layer 3 TE topology, which both inherits 13 unicast topology properties and is capable of TE.

```

augment /nw:networks/nw:network/nw:network-types
  /l3t:l3-unicast-topology:
    +-rw l3-te!

```

3. Packet Switching Technology Extensions

The technology agnostic TE Topology model is defined in [[RFC8795](#)], which is extended by this document to cover the Packet Switch Capable (PSC) technology [[RFC3471](#)] [[RFC7074](#)].

[3.1.](#) Technology Specific Link Attributes

The technology agnostic TE Topology model is augmented with packet switching specific link attributes:

```

augment /nw:networks/tet:te/tet:templates/tet:link-template
    /tet:te-link-attributes
    /tet:interface-switching-capability:
    +-rw packet-switch-capable
        +-rw minimum-lsp-bandwidth?    rt-types:bandwidth-ieee-float32
        +-rw interface-mtu?          uint16
augment /nw:networks/nw:network/nt:link/tet:te
    /tet:te-link-attributes
    /tet:interface-switching-capability:
    +-rw packet-switch-capable
        +-rw minimum-lsp-bandwidth?    rt-types:bandwidth-ieee-float32
        +-rw interface-mtu?          uint16
augment /nw:networks/nw:network/nt:link/tet:te
    /tet:information-source-entry
    /tet:interface-switching-capability:
    +-ro packet-switch-capable
        +-ro minimum-lsp-bandwidth?    rt-types:bandwidth-ieee-float32
        +-ro interface-mtu?          uint16

```

[3.2.](#) Performance Metric

[[RFC7471](#)], [[RFC8570](#)] and [[RFC7823](#)] specify TE performance metric parameters and their usage. The packet switching augmentations specified in this document support such a capability, which can be conditional enabled by a YANG feature "te-performance-metric".

```

augment /nw:networks/nw:network/nw:node/tet:te
    /tet:te-node-attributes/tet:connectivity-matrices:
    +-rw performance-metric
        +-rw measurement
        |     .....
        +-rw normality
        |     .....
        +-rw throttle
        .....

```

Such an augmentation has been applied to:

- o Connectivity matrices container
- o Connectivity matrix entry
- o Local link connectivities container

- o Local link connectivity entry
- o TE link attributes container in a TE link template
- o TE link attributes container in a TE link
- o Information source entry in a TE link

4. Complete Model Tree Structure

4.1. Layer 3 TE Topology Module

The model tree structure of the layer 3 TE topology module is as shown below:

```
module: ietf-l3-te-topology
augment /nw:networks/nw:network/nw:network-types
    /l3t:l3-unicast-topology:
        +-rw l3-te!
augment /nw:networks/nw:network/l3t:l3-topology-attributes:
    +-rw l3-te-topology-attributes
        +-rw network-ref? -> /nw:networks/network/network-id
augment /nw:networks/nw:network/nw:node/l3t:l3-node-attributes:
    +-rw l3-te-node-attributes
        +-rw node-ref?      leafref
        +-rw network-ref? -> /nw:networks/network/network-id
augment /nw:networks/nw:network/nw:node/nt:termination-point
    /l3t:l3-termination-point-attributes:
        +-rw l3-te-tp-attributes
            +-rw tp-ref?      leafref
            +-rw node-ref?      leafref
            +-rw network-ref? -> /nw:networks/network/network-id
augment /nw:networks/nw:network/nt:link/l3t:l3-link-attributes:
    +-rw l3-te-link-attributes
        +-rw link-ref?      leafref
        +-rw network-ref? -> /nw:networks/network/network-id
```

4.2. Packet Switching TE Topology Module

This is an augmentation to base TE topology model.

4.2.1. Network Types

This augments the network types with a new network type for TE packet topologies.

```
module: ietf-te-topology-packet
augment /nw:networks/nw:network/nw:network-types/tet:te-topology:
  +-rw packet!
```

4.2.2. Node Connectivity Matrix Attributes

This augments the node connectivity matrix attributes with configuration and states for performance metrics when the network type is packet.

```
augment /nw:networks/nw:network/nw:node/tet:te
  /tet:te-node-attributes/tet:connectivity-matrices:
    +-ro performance-metrics-one-way {te-performance-metric}?
      | +-ro one-way-delay?                                uint32
      | +-ro one-way-delay-normality?
      |   |   te-types:performance-metrics-normality

4.2.8. Link Template for Packet-specific Attributes

This augments the link template attributes with configuration and states for packet-specific attributes when the network type is packet.

```

augment /nw:networks/tet:te/tet:templates/tet:link-template
  /tet:te-link-attributes
  /tet:interface-switching-capability:
    +-+rw packet-switch-capable
      +-+rw minimum-lsp-bandwidth?  rt-types:bandwidth-ieee-float32
      +-+rw interface-mtu?         uint16

```

4.2.9. Link for Packet-specific Attributes

This augments the link attributes with configuration and states for packet-specific attributes when the network type is packet.

```

augment /nw:networks/nw:network/nt:link/tet:te
    /tet:te-link-attributes
    /tet:interface-switching-capability:
        +-rw packet-switch-capable
            +-rw minimum-lsp-bandwidth?    rt-types:bandwidth-ieee-float32
            +-rw interface-mtu?          uint16

```

[4.2.10.](#) Link Information Source for Packet-specific Attributes

This augments the link information source with states for packet-specific attributes when the network type is packet.

```

augment /nw:networks/nw:network/nt:link/tet:te
    /tet:information-source-entry
    /tet:interface-switching-capability:
        +-ro packet-switch-capable
            +-ro minimum-lsp-bandwidth?    rt-types:bandwidth-ieee-float32
            +-ro interface-mtu?          uint16

```

[7.](#) Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [[RFC6241](#)] or RESTCONF [[RFC8040](#)]. The lowest NETCONF layer

is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [[RFC6242](#)]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [[RFC8446](#)].

The Network Configuration Access Control Model (NACM) [[RFC8341](#)] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

/nw:networks/nw:network/nw:network-types/l3t:l3-unicast-topology/
13-te

This subtree specifies the layer 3 TE topology type. Modifying the configurations can make layer 3 TE topology type invalid and cause interruption to all layer 3 TE networks.

/nw:networks/nw:network/l3t:l3-topology-attributes/l3-te-topology-
attributes

This subtree specifies the topology-wide configurations, including the reference to a TE topology from a layer 3 TE topology. Modifying the configurations here can cause traffic disabled or rerouted in this topology and the connected topologies.

/nw:networks/nw:network/nw:node/l3t:l3-node-attributes/l3-te-node-
attributes

This subtree specifies the configurations of layer 3 TE nodes. Modifying the configurations in this subtree can change the relationship between a TE node and a node in a layer 3 TE topology, causing traffic disabled or rerouted in the specified nodes and the related layer 3 topologies.

/nw:networks/nw:network/nw:node/nt:termination-point//l3t:l3-
termination-point-attributes/l3-te-tp-attributes

This subtree specifies the configurations of layer 3 TE link termination points. Modifying the configurations in this subtree can change the relationship between a TE link termination point and a link termination point in a layer 3 TE topology, causing traffic disabled or rerouted on the related layer 3 links and the related layer 3 topologies.

/nw:networks/nw:network/nt:link/l3t:l3-link-attributes/l3-te-link-attributes

This subtree specifies the configurations of layer 3 TE links. Modifying the configurations in this subtree can change the relationship between a TE link and a link in a layer 3 TE topology, causing traffic disabled or rerouted on the specified layer 3 link and the related layer 3 topologies.

performance-metric containers

The container "performance-metric" is augmented to multiple locations of the base TE topology model, as specified in [Section 3.2](#). Modifying the configuration in such a container can change the behaviors of performance metric monitoring, causing traffic disabled or rerouted on the related layer 3 links, nodes, or topologies.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

/nw:networks/nw:network/nw:network-types/l3t:l3-unicast-topology/l3-te

Unauthorized access to this subtree can disclose the layer 3 TE topology type.

/nw:networks/nw:network/l3t:l3-topology-attributes/l3-te-topology-attributes

Unauthorized access to this subtree can disclose the topology-wide configurations, including the reference to a TE topology from a layer 3 topology.

/nw:networks/nw:network/nw:node/l3t:l3-node-attributes/l3-te-node-attributes

Unauthorized access to this subtree can disclose the operational state information of layer 3 TE nodes.

/nw:networks/nw:network/nw:node/nt:termination-point//l3t:l3-termination-point-attributes/l3-te-tp-attributes

Unauthorized access to this subtree can disclose the operational state information of layer 3 TE link termination points.

/nw:networks/nw:network/nt:link/l3t:l3-link-attributes/l3-te-link-attributes

Unauthorized access to this subtree can disclose the operational state information of layer 3 TE links.

performance-metric containers

The container "performance-metric" is augmented to multiple locations of the base TE topology model, as specified in [Section 3.2](#). Unauthorized access to this subtree can disclose the operational state information of performance metric monitoring.

Appendix A. Companion YANG Model for Non-NMDA Compliant Implementations

The YANG modules `ietf-l3-te-topology` and `ietf-te-topology-packet` defined in this document are designed to be used in conjunction with implementations that support the Network Management Datastore Architecture (NMDA) defined in [[RFC8342](#)]. In order to allow implementations to use the model even in cases when NMDA is not supported, the following companion modules, `ietf-l3-te-topology-state` and `ietf-te-topology-packet-state`, are defined as state models, which mirror the modules `ietf-l3-te-topology` and `ietf-te-topology-packet` defined earlier in this document. However, all data nodes in the companion module are non-configurable, to represent the applied configuration or the derived operational states.

The companion modules, `ietf-l3-te-topology-state` and `ietf-te-topology-packet-state`, are redundant and SHOULD NOT be supported by implementations that support NMDA.

As the structure of the companion modules mirrors that of the cooresponding NMDA models, the YANG trees of the companion modules are not depicted separately.

A.1. Layer 3 TE Topology State Module

This module references [[RFC8345](#)], and [[RFC8346](#)].

Appendix B. Data Tree Example

This section contains an example of an instance data tree in the JSON encoding [[RFC7951](#)]. The example instantiates "ietf-l3-te-topology" for the topology that is depicted in the following diagram.

The corresponding instance data tree is depicted below. Note that some lines have been wrapped to adhere to the 72-character line limitation of RFCs.

```
{
  "ietf-network:networks": {
    "network": [
      {
        "network-id": "example-topo-te",
        "network-types": {
          "ietf-te-topology:te-topology": {}
        }
      },
    ],
  }
}
```

```
