A YANG Data Model for Traffic Engineering Tunnels and Interfaces
[draft-ietf-teas-yang-te-13](#)

Abstract

This document defines a YANG data model for the configuration and management of Traffic Engineering (TE) interfaces, tunnels and Label Switched Paths (LSPs). The model is divided into YANG modules that classify data into generic, device-specific, technology agnostic, and technology-specific elements. The model also includes module(s) that contain reusable TE data types and data groupings.

This model covers data for configuration, operational state, remote procedural calls, and event notifications.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 4, 2018.

Authors' Addresses [168](#)

[1. Introduction](#)

YANG [[RFC6020](#)] is a data definition language that was introduced to define the contents of a conceptual data store that allows networked devices to be managed using NETCONF [[RFC6241](#)]. YANG is proving relevant beyond its initial confines, as bindings to other interfaces (e.g. RESTCONF [[RFC8040](#)]) and encoding other than XML (e.g. JSON) are being defined. Furthermore, YANG data models can be used as the basis of implementation for other interfaces, such as CLI and programmatic APIs.

This document describes the YANG data models for TE Tunnels, Label Switched Paths (LSPs) and TE interfaces that cover data applicable to generic or device-independent, device-specific, Multiprotocol Label Switching (MPLS) technology specific, and Segment Routing (SR) TE technology. It also describes helper modules that define TE grouping(s) and data types that can be imported by other modules.

The document defines the high-level relationship between the modules defined in this document, as well as other external protocol modules. It is expected other data plane technology model(s) will augment the TE generic model. Also, the TE generic model does not include any data specific to a signaling protocol. It is expected YANG models for TE signaling protocols, such as RSVP-TE ([\[RFC3209\]](#), [\[RFC3473\]](#)), or Segment-Routing TE (SR-TE) will augment the TE generic module.

[1.1. Terminology](#)

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#), [RFC 2119](#) [[RFC2119](#)].

[1.2. Tree Diagram](#)

A simplified graphical representation of the data model is presented in each section of the model. The following notations are used for the YANG model data tree representation.

Saad, et al.

Expires September 4, 2018

[Page 3]

```
<status> <flags> <name> <opts> <type>

<status> is one of:
+ for current
x for deprecated
o for obsolete

<flags> is one of:
rw for read-write configuration data
ro for read-only non-configuration data
-x for execution rpcs
-n for notifications

<name> is the name of the node
```

If the node is augmented into the tree from another module, its name is printed as <prefix>:<name>

```
<opts> is one of:
? for an optional leaf or node
! for a presence container
* for a leaf-list or list
Brackets [<keys>] for a list's keys
Curly braces {<condition>} for optional feature that make node
conditional
Colon : for marking case nodes
Ellipses (...) subtree contents not shown
```

Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (:).

<type> is the name of the type for leafs and leaf-lists.

[1.3. Prefixes in Data Node Names](#)

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in Table 1.

Prefix	YANG module	Reference
yang	ietf-yang-types	[RFC6991]
inet	ietf-inet-types	[RFC6991]
te	ietf-te	this document
te-types	ietf-te-types	this document
te-mpls-types	ietf-te-mpls-types	this document
te-dev	ietf-te-device	this document
te-mpls	ietf-te-mpls	this document
te-sr-mpls	ietf-te-sr-mpls	this document

Table 1: Prefixes and corresponding YANG modules

1.4. Open Issues and Next Steps

This section describes the number of open issues that are under consideration. As issues are resolved, this section will be updated to reflect this and be left there for reference. It is expected that all the issues in this section will be addressed before the document will be ready for final publication.

1.4.1. TE Technology Models

This document describes the generic TE YANG data model that is independent of any dataplane technology. One of the design objectives is to allow specific data plane technologies models to reuse the generic TE data model and possibly augment it with technology specific data model(s). There are multiple options being considered to achieve this:

- o The generic TE model, including the lists of TE tunnels, LSPs, and interfaces can be defined and rooted at the top of the YANG tree. Specific leaf(s) under the TE tunnel, LSP, or interface, in this case, can identify the specific technology layer that it belongs to. This approach implies a single list for each of TE tunnel(s), LSP(s), and interface(s) in the model carries elements of different technology layers.
- o An instance of the generic TE YANG model can be mounted in the YANG tree once for each TE technology layer(s). This approach provides separation of elements belonging to different technology layers into separate lists per layer in the data model.
- o The generic TE data node(s) and TE list(s) for tunnels, LSPs, and interfaces are defined as grouping(s) in a separate module. The

Saad, et al.

Expires September 4, 2018

[Page 5]

specific technology layer imports the generic TE groupings and uses them their respective technology specific module.

This revision of the model leverages the LSP encoding type of a tunnel (and interfaces) to identify the specific technology associated with the a TE interfaces, tunnel(s) and the LSP(s). For example, for an MPLS TE LSP, the LSP encoding type is assumed to be "lsp-encoding-packet".

Finally, the TE generic model does not include any signaling protocol data. It is expected that TE signaling protocol module(s) will be defined in other document(s) that will cover the RSVP-TE ([[RFC3209](#)], [[RFC3473](#)]), and Segment-Routing TE (SR-TE) model and that augment the TE generic model.

1.4.2. State Data Organization

Pure state data (for example, ephemeral or protocol derived state objects) can be modeled using one of the options below:

- o Contained inside a read-write container, in a "state" sub-container, as shown in Figure 3
- o Contained inside a separate read-only container, for example a lsps-state container

The Network Management Datastore Architecture (NMDA) addresses the "OpState" that was discussed in the IETF. As per NMDA guidelines for new models and models that are not concerned with the operational state of configuration information, this revision of the draft adopts the NMDA proposal for configuration and state data of this model.

2. Model Overview

The data model defined in this document covers the core TE features that are commonly supported across different vendor implementations. The support of extended or vendor specific TE feature(s) are expected to be in augmentations to the data models defined in this document.

2.1. Module(s) Relationship

The TE generic model defined in "ietf-te.yang" covers the building blocks that are device independent and agnostic of any specific technology or control plane instances. The TE device model defined in "ietf-te-device.yang" augments the TE generic model and covers data that is specific to a device - for example, attributes of TE interfaces, or TE timers that are local to a TE node.

Saad, et al.

Expires September 4, 2018

[Page 6]

The TE data relevant to a specific instantiation of data plane technology exists in a separate YANG module(s) that augment the TE generic model. For example, the MPLS-TE module "ietf-te-mpls.yang" is defined in Figure 10 and augments the TE generic model as shown in Figure 1. Similarly, the module "ietf-te-sr-mpls.yang" models the Segment Routing (SR) TE specific data and augments the TE generic and MPLS-TE model(s).

The TE data relevant to a TE specific signaling protocol instantiation is outside the scope and is covered in other documents. For example, the RSVP-TE [[RFC3209](#)] YANG model augmentation of the TE model is covered in [[I-D.ietf-teas-yang-rsvp](#)], and other signaling protocol model(s) (e.g. for Segment-Routing TE) are expected to also augment the TE generic model.

Figure 1: Relationship of TE module(s) with other signaling protocol modules

Saad, et al.

Expires September 4, 2018

[Page 7]

Figure 2: Relationship between generic and technology specific TE types modules

2.2. Design Considerations

The following considerations with respect data organization are taken into account:

- o reusable data elements are grouped into separate TE types module(s) that can be readily imported by other modules whenever needed
- o reusable TE data types that are data plane independent are grouped in the TE generic types module "ietf-te-types.yang"
- o reusable TE data elements that are data plane specific (e.g. packet MPLS or switching technologies as defined in [[RFC3473](#)]) are expected to be grouped in a technology- specific types module, e.g. "ietf-te-mpls-types.yang". It is expected that technology specific types will augment TE generic types as shown in Figure 2
- o The TE generic model contains device independent data and can be used to model data off a device (e.g. on a controller). The TE data that is device-specific are grouped in a separate module as shown in Figure 1.
- o In general, little information in the model is designated as "mandatory", to allow freedom to vendors to adapt the data model to their specific product implementation.

Saad, et al.

Expires September 4, 2018

[Page 8]

2.3. Optional Features

Optional features that are beyond the base TE model are left to the specific vendor to decide support using vendor model augmentation and/or using feature checks.

This model declares a number of TE functions as features (such as P2MP-TE, soft-preemption etc.).

2.4. Configuration Inheritance

The defined data model supports configuration inheritance for tunnels, paths, and interfaces. Data elements defined in the main container (e.g. that encompasses the list of tunnels, interfaces, or paths) are assumed to apply equally to all elements of the list, unless overridden explicitly for a certain element of a list (e.g. a tunnel, interface or path).

3. TE Generic Model Organization

The TE generic model covers configuration, state, RPCs, and notifications data pertaining to TE global parameters, interfaces, tunnels and LSPs parameters that are device independent.

The container "te" is the top level container in this data model. The presence of this container is expected to enable TE function system wide.

The model follows the guidelines in for modeling the intended, applied and derived state.

```

Figure 3: TE generic highlevel model view

[3.1.](#) Global Configuration and State Data

This branch of the data model covers configurations that control TE features behavior system-wide, and its respective state. Examples of such configuration data are:

- o Table of named SRLG mappings
- o Table of named (extended) administrative groups mappings
- o Table of named explicit paths to be referenced by TE tunnels
- o Table of named path-constraints sets
- o Auto-bandwidth global parameters
- o TE diff-serve TE-class maps
- o System-wide capabilities for LSP reoptimization (included in the TE device model)
 - * Reoptimization timers (periodic interval, LSP installation and cleanup)
- o System-wide capabilities for TE state flooding (included in the TE device model)

Saad, et al.

Expires September 4, 2018

[Page 10]

- * Periodic flooding interval
- o Global capabilities that affect the originating, traversing and terminating LSPs. For example:
 - * Path selection parameters (e.g. metric to optimize, etc.)
 - * Path or segment protection parameters

The global state data is represented under the global "state" sub-container as shown in Figure 3.

Examples of such states are:

- o Global statistics (signaling, admission, preemption, flooding)
- o Global counters (number of tunnels/LSPs/interfaces)

3.2. Interfaces Configuration and State Data

This branch of the model covers configuration and state data items corresponding to TE interfaces that are present on a specific device. A new module is introduced that holds the TE device specific properties.

Examples of TE interface properties are:

- o Maximum reservable bandwidth, bandwidth constraints (BC)
- o Flooding parameters
 - * Flooding intervals and threshold values
- o Fast reroute backup tunnel properties (such as static, auto-tunnel)
- o interface attributes
 - * (Extended) administrative groups
 - * SRLG values
 - * TE metric value

The state corresponding to the TE interfaces applied configuration, protocol derived state, and stats and counters all fall under the interface "state" sub-container as shown in Figure 4 below:

```
module: ietf-te
  +-+rw te!
    +-+rw interfaces
      .
        +-+ rw te-attributes
          +-+ rw config
            <<intended configuration>>
      .
        +-+ ro state
          <<applied configuration>>
          <<derived state associated with the TE interface>>
```

Figure 4: TE interface state

This covers state data for TE interfaces such as:

- o Bandwidth information: maximum bandwidth, available bandwidth at different priorities and for each class-type (CT)
- o List of admitted LSPs
 - * Name, bandwidth value and pool, time, priority
- o Statistics: state counters, flooding counters, admission counters (accepted/rejected), preemption counters
- o Adjacency information
 - * Neighbor address
 - * Metric value

3.3. Tunnels Configuration and State Data

This branch of the model covers intended, and corresponding applied configuration for tunnels. As well, it holds possible derived state pertaining to TE tunnels.

```
module: ietf-te
  +-+rw te!
    +-+rw tunnels
      . . .
      +-+ rw config
        <<intended configuration>>
      . . .
      +-+ ro state
        <<applied configuration>>
        <<derived state associated with the tunnel>>
```

Figure 5: TE interface state tree

Examples of tunnel configuration data for TE tunnels:

- o Name and type (e.g. P2P, P2MP) of the TE tunnel
- o Admin-state
- o Set of primary and corresponding secondary paths
- o Routing usage (auto-route announce, forwarding adjacency)
- o Policy based routing (PBR) parameters

3.3.1. Tunnel Compute-Only Mode

By default, a configured TE tunnel is provisioned so it can carry traffic as soon as a valid path is computed and an LSP instantiated in the network. In other cases, a TE tunnel may be provisioned for computed path reporting purposes without the need to instantiate an LSP or commit resources in the network. In such a case, a tunnel configuration in "compute-only" mode to distinguish it from default tunnel behavior.

A "compute-only" TE tunnel is configured as a usual TE tunnel with associated path constraint(s) and properties on a device or controller. The device or controller is expected to compute the feasible path(s) subject to configured constraints for of "compute-only" tunnel and reflect the computed path(s) in the LSP(s) Record-Route Object (RRO) list. A client may query "on-demand" the "compute-only" TE tunnel computed path(s) properties by querying the state of the tunnel. Alternatively, the client can subscribe on the "compute-only" TE tunnel to be notified of computed path(s) and whenever it changes.

3.3.2. Tunnel Hierarchical Link Endpoint

TE LSPs can be set up in MPLS or Generalized MPLS (GMPLS) networks to be used to form links to carry traffic in other (client) networks [[RFC6107](#)]. In this case, the model introduces the TE tunnel hierarchical link endpoint parameters to identify the specific link in the client layer that the TE tunnel is associated with.

3.4. TE LSPs State Data

TE LSPs are derived state data that is usually instantiated via signaling protocols. TE LSPs exists on routers as ingress (starting point of LSP), transit (mid-point of LSP), or egress (termination point of the LSP). TE LSPs are distinguished by the 5 tuple, and LSP type (P2P or P2MP). In the model, the nodes holding LSPs data exist in the read-only lsps-state list as show in Figure 6.

3.5. Global RPC Data

This branch of the model covers system-wide RPC execution data to trigger actions and optionally expect responses. Examples of such TE commands are to:

- o Clear global TE statistics of various features

3.6. Interface RPC Data

This collection of data in the model defines TE interface RPC execution commands. Examples of these are to:

- o Clear TE statistics for all or for individual TE interfaces
- o Trigger immediate flooding for one or all TE interfaces

3.7. Tunnel RPC Data

This branch of the model covers TE tunnel RPC execution data to trigger actions and optionally expect responses. Examples of such TE commands are:

- o Clear statistics for all or for individual tunnels
- o Trigger the tear and setup of existing tunnels or LSPs.

3.8. Global Notifications Data

This branch of the model covers system-wide notifications data. The node notifies the registered events to the server using the defined notification messages.

3.9. Interfaces Notifications Data

This branch of the model covers TE interfaces related notifications data. The TE interface configuration is used for specific events registration. Notifications are sent for registered events to the server. Example events for TE interfaces are:

- o Interface creation and deletion
- o Interface state transitions
- o (Soft) preemption triggers
- o Fast reroute activation

3.10. Tunnel Notification Data

This branch of the model covers TE tunnels related notifications data. The TE tunnels configuration is used for specific events registration. Notifications are sent for registered events to the server. Example events for TE tunnels are:

- o Tunnel creation and deletion events
- o Tunnel state up/down changes
- o Tunnel state reoptimization changes

Figure Figure 6 below shows the tree diagram of the YANG model defined in modules: `ietf-te.yang`, `ietf-te-device.yang`, `ietf-te-mpls.yang`, and `ietf-te-sr.yang`.

description
"This is the generic bandwidth type that is a string containing
a list of numbers separated by commas, with each of these
number can be non-negative decimal, hex integer, or hex float:
(dec | hex | float)[*(','(dec | hex | float))]
For packet switching type, a float number is used, such as
0x1p10.
For OTN switching type, a list of integers can be used, such
as '0,2,3,1', indicating 2 odu0's and 1 odu3.
For DWDM, a list of pairs of slot number and width can be
used, such as '0, 2, 3, 3', indicating a frequency slot 0 with
slot width 2 and a frequency slot 3 with slot width 3.";

Figure 12: SR TE MPLS YANG module

5. IANA Considerations

This document registers the following URIs in the IETF XML registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration is requested to be made.

URI: urn:ietf:params:xml:ns.yang:ietf-te XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns.yang:ietf-te-device XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns.yang:ietf-te-mpls XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns.yang:ietf-te-sr-mpls XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns.yang:ietf-te-types XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns.yang:ietf-te-mpls-types XML: N/A, the requested URI is an XML namespace.

This document registers a YANG module in the YANG Module Names registry [[RFC6020](#)].

name: ietf-te namespace: urn:ietf:params:xml:ns.yang:ietf-te prefix: ietf-te reference: [RFC3209](#)

name: ietf-te-device namespace: urn:ietf:params:xml:ns.yang:ietf-te prefix: ietf-te-device reference: [RFC3209](#)

name: ietf-te-mpls namespace: urn:ietf:params:xml:ns.yang:ietf-te-mpls prefix: ietf-te-mpls reference: [RFC3209](#)

name: ietf-te-sr-mpls namespace: urn:ietf:params:xml:ns.yang:ietf-te-sr-mpls prefix: ietf-te-sr-mpls

name: ietf-te-types namespace: urn:ietf:params:xml:ns.yang:ietf-te-types prefix: ietf-te-types reference: [RFC3209](#)

name: ietf-te-mpls-types namespace: urn:ietf:params:xml:ns.yang:ietf-te-mpls-types prefix: ietf-te-mpls-types reference: [RFC3209](#)

[6. Security Considerations](#)

The YANG module defined in this memo is designed to be accessed via the NETCONF protocol [[RFC6241](#)]. The lowest NETCONF layer is the secure transport layer and the mandatory-to-implement secure transport is SSH [[RFC6242](#)]. The NETCONF access control model [[RFC6536](#)] provides means to restrict access for particular NETCONF

users to a pre-configured subset of all available NETCONF protocol operations and content.

There are a number of data nodes defined in the YANG module which are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., <edit-config>) to these data nodes without proper protection can have a negative effect on network operations. Following are the subtrees and data nodes and their sensitivity/vulnerability:

"`/te/globals`": This module specifies the global TE configurations on a device. Unauthorized access to this container could cause the device to ignore packets it should receive and process.

"`/te/tunnels`": This list specifies the configured TE tunnels on a device. Unauthorized access to this list could cause the device to ignore packets it should receive and process.

"`/te/lsp-state`": This list specifies the state derived LSPs. Unauthorized access to this list could cause the device to ignore packets it should receive and process.

"`/te/interfaces`": This list specifies the configured TE interfaces on a device. Unauthorized access to this list could cause the device to ignore packets it should receive and process.

[7. Acknowledgement](#)

The authors would like to thank the members of the multi-vendor YANG design team who are involved in the definition of this model.

The authors would also like to thank Loa Andersson, Lou Berger, Sergio Belotti, Italo Busi, Carlo Perocchio, Francesco Lazzeri, Aihua Guo, Dhruv Dhody, Anurag Sharma, and Xian Zhang for their comments and providing valuable feedback on this document.
