A YANG Data Model for Traffic Engineering Tunnels, Label Switched Paths and Interfaces

draft-ietf-teas-yang-te-27

Abstract

This document defines a YANG data model for the provisioning and management of Traffic Engineering (TE) tunnels, Label Switched Paths (LSPs), and interfaces. The model is divided into YANG modules that classify data into generic, device-specific, technology agnostic, and technology-specific elements.

This model covers data for configuration, operational state, remote procedural calls, and event notifications.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 9, 2022.

1. Introduction

YANG [RFC6020] and [RFC7950] is a data modeling language that was introduced to define the contents of a conceptual data store that allows networked devices to be managed using NETCONF [RFC6241]. YANG has proved relevant beyond its initial confines, as bindings to other interfaces (e.g. RESTCONF [RFC8040]) and encoding other than XML (e.g. JSON) are being defined. Furthermore, YANG data models can be used as the basis of implementation for other interfaces, such as CLI and programmatic APIs.

This document describes YANG data model for Traffic Engineering (TE) tunnels, Label Switched Paths (LSPs), and interfaces. The model covers data applicable to generic or device-independent, device-specific, and Multiprotocol Label Switching (MPLS) technology specific.

The document describes a high-level relationship between the modules defined in this document, as well as other external protocol YANG modules. The TE generic YANG data model does not include any data specific to a signaling protocol. It is expected other data plane technology model(s) will augment the TE generic YANG data model.

Also, it is expected other YANG module(s) that model TE signaling protocols, such as RSVP-TE ([RFC3209], [RFC3473]), or Segment-Routing TE (SR-TE) [I-D.ietf-spring-segment-routing-policy] will augment the generic TE YANG module.

2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

The following terms are defined in $[{\tt RFC6241}]$ and are used in this specification:

- o client
- o configuration data

o state data

This document also makes use of the following terminology introduced in the YANG Data Modeling Language [RFC7950]:

- o augment
- o data model
- o data node

2.1. Prefixes in Data Node Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in Table 1.

+ Prefix	+ YANG module	+ Reference
yang	ietf-yang-types	++ [<u>RFC6991</u>]
inet	 ietf-inet-types 	 [<u>RFC6991</u>]
rt-types	ו ietf-routing-types ו	 [<u>RFC8294]</u>
te-types	ı ietf-te-types 	
te-packet-types	ı ietf-te-packet-types 	 [<u>RFC8776</u>]
 te	 ietf-te 	this document this document
te-dev	 ietf-te-device +	 this document +

Table 1: Prefixes and corresponding YANG modules

2.2. Model Tree Diagrams

The tree diagrams extracted from the module(s) defined in this document are given in subsequent sections as per the syntax defined in [RFC8340].

3. Design Considerations

This document describes a generic TE YANG data model that is independent of any dataplane technology. One of the design objectives is to allow specific data plane technology models to reuse

the TE generic data model and possibly augment it with technology specific data.

The elements of the generic TE YANG data model, including TE Tunnels, LSPs, and interfaces have leaf(s) that identify the technology layer where they reside. For example, the LSP encoding type can identify the technology associated with a TE Tunnel or LSP.

Also, the generic TE YANG data model does not cover signaling protocol data. The signaling protocol used to instantiate TE LSPs are outside the scope of this document and expected to be covered by augmentations defined in other document(s).

The following other design considerations are taken into account with respect data organization:

- o The generic TE YANG data model 'ietf-te' contains device independent data and can be used to model data off a device (e.g. on a TE controller). The device-specific TE data is defined in module 'ietf-te-device' as shown in Figure 1,
- o In general, minimal elements in the model are designated as "mandatory" to allow freedom to vendors to adapt the data model to their specific product implementation.
- o Suitable defaults are specified for all configurable elements.
- o The model declares a number of TE functions as features that can be optionally supported.

3.1. State Data Organization

The Network Management Datastore Architecture (NMDA) [RFC8342] addresses modeling state data for ephemeral objects. This document adopts the NMDA model for configuration and state data representation as per IETF guidelines for new IETF YANG models.

4. Model Overview

The data models defined in this document cover the core TE features that are commonly supported by different vendor implementations. The support of extended or vendor specific TE feature(s) is expected to be in either augmentations, or deviations to the model defined in this document.

4.1. Module Relationship

The generic TE YANG data model that is defined in "ietf-te.yang" covers the building blocks that are device independent and agnostic of any specific technology or control plane instances. The TE device model defined in "ietf-te-device.yang" augments the generic TE YANG data model and covers data that is specific to a device - for example, attributes of TE interfaces, or TE timers that are local to a TE node.

The TE data model for specific instances of data plane technology exist in a separate YANG module(s) that augment the generic TE YANG data model. For example, the MPLS-TE module "ietf-te-mpls.yang" is defined in another document and augments the TE generic model as shown in Figure 1.

The TE data model for specific instances of signaling protocol are outside the scope of this document and are defined in other documents. For example, the RSVP-TE YANG model augmentation of the TE model is covered in [I-D.ietf-teas-yang-rsvp].

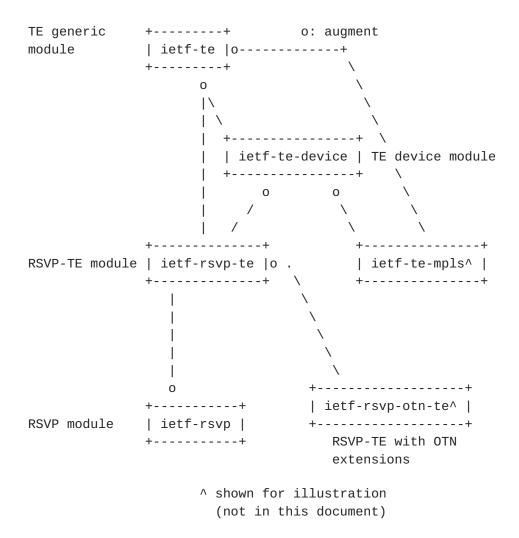

Figure 1: Relationship of TE module(s) with signaling protocol modules

5. TE YANG Model

The generic TE YANG module ('ietf-te') is meant to manage and operate a TE network. This includes creating, modifying and retrieving TE Tunnels, LSPs, and interfaces and their associated attributes (e.g. Administrative-Groups, SRLGs, etc.).

The detailed tree structure is provided in Figure 2.

5.1. Module Structure

The 'ietf-te' uses three main containers grouped under the main 'te' container (see Figure 2). The 'te' container is the top level container in the data model. The presence of the 'te' container

enables TE function system wide. Below provides further descriptions of containers that exist under the 'te' top level container.

globals:

The 'globals' container maintains the set of global TE attributes that can be applicable to TE Tunnel(s) and interface(s).

tunnels:

The 'tunnels' container includes the list of TE Tunnels that are instantiated. Refer to $\underline{\text{Section 5.1.2}}$ for further details on the properties of a TE Tunnel.

lsps:

The 'lsps' container includes the list of TE LSP(s) that are instantiated for TE Tunnels. Refer to $\frac{\text{Section 5.1.3}}{\text{Section 5.1.3}}$ for further details on the properties of a TE LSP.

tunnels-path-compute:

A Remote Procedure Call (RPC) to request path computation for a specific TE Tunnel. The RPC allows requesting path computation using atomic and stateless operation. A tunnel may also be configured in 'compute-only' mode to provide stateful path updates - see Section 5.1.2 for further details.

tunnels-action:

An RPC to request a specific action (e.g. reoptimize, or tear-and-setup) to be taken on a specific tunnel or all tunnels.

Internet-Draft TE YANG Data Model July 2021

Figure 2: TE Tunnel model high-level YANG tree view

5.1.1. TE Globals

The 'globals' container covers properties that control TE features behavior system-wide, and its respective state (see Figure 3). The TE globals configuration include:

```
+--rw globals
| +--rw named-admin-groups
| | +--rw named-admin-group* [name]
...
| +--rw named-srlgs
| | +--rw named-srlg* [name] {te-types:named-srlg-groups}?
...
| +--rw named-path-constraints
| | +--rw named-path-constraint* [name]
...
```

Figure 3: TE globals YANG subtree high-level structure

named-admin-groups:

A YANG container for the list of named (extended) administrative groups that may be applied to TE links.

named-srlgs:

A YANG container for the list named Shared Risk Link Groups (SRLGs) that may be applied to TE links.

named-path-constraints:

Internet-Draft TE YANG Data Model July 2021

A YANG container for a list of named path constraints. Each named path constraint is composed of a set of constraints that can be applied during path computation. A named path constraint can be applied to multiple TE Tunnels. Path constraints may also be specified directly under the TE Tunnel. The path constraint specified under the TE Tunnel take precedence over the path constraints derived from the referenced named path constraint. A named path constraint entry can be formed up of the following path constraints:

```
+--rw named-path-constraints
    +--rw named-path-constraint* [name]
+--rw name
                                             string
        +--rw te-bandwidth
// ...
       +--rw link-protection?
                                            identityref
       +--rw setup-priority?
                                            uint8
+--rw hold-priority?
                                            uint8
       +--rw signaling-type?
                                             identityref
       +--rw path-metric-bounds
// ...
       +--rw path-affinities-values
// ...
       +--rw path-affinity-names
// ...
       +--rw path-srlgs-lists
       +--rw path-srlgs-names
// ...
+--rw disjointness?
       te-path-disjointness
// ...
       +--rw explicit-route-objects-always
// ...
       | +--rw route-object-exclude-always* [index]
        +--rw route-object-include-exclude* [index]
```

Figure 4: Named path constraints YANG subtree

⁺ te-bandwidth: A YANG container that holds the technology agnostic TE bandwidth constraint.

- + link-protection: A YANG leaf that holds the link protection type constraint required for the links to be included in the computed path.
- + setup/hold priority: A YANG leaf that holds the LSP setup and hold admission priority as defined in [RFC3209].
- + signaling-type: A YANG leaf that holds the LSP setup type, such as RSVP-TE or SR.
- + path-metric-bounds: A YANG container that holds the set of metric bounds applicable on the computed TE tunnel path.
- + path-affinities-values: A YANG container that holds the set of affinity values and mask to be used during path computation.
- + path-affinity-names: A YANG container that holds the set of named affinity constraints and corresponding inclusion or exclusions instruction for each to be used during path computation.
- + path-srlgs-lists: A YANG container that holds the set of SRLG values and corresponding inclusion or exclusions instruction to be used during path computation.
- + path-srlgs-names: A YANG container that holds the set of named SRLG constraints and corresponding inclusion or exclusions instruction for each to be used during path computation.
- + disjointness: The level of resource disjointness constraint that the secondary path of a TE tunnel has to adhere to.
- + explicit-route-objects-always: A YANG container that contains two route objects lists:
 - 'route-object-exclude-always': a list of route entries to always exclude from the path computation.
 - 'route-object-include-exclude': a list of route entries to include or exclude in the path computation.

The 'route-object-include-exclude' is used to configure constraints on which route objects (e.g., nodes, links) are included or excluded in the path computation.

Saad, et al. Expires January 9, 2022 [Page 11]

The interpretation of an empty 'route-object-include-exclude' list depends on the TE Tunnel (end-to-end or Tunnel Segment) and on the specific path, according to the following rules:

- An empty 'route-object-include-exclude' list for the primary path of an end-to-end TE Tunnel indicates that there are no route objects to be included or excluded in the path computation.
- 2. An empty 'route-object-include-exclude' list for the primary path of a TE Tunnel Segment indicates that no primary LSP is required for that TE Tunnel.
- 3. An empty 'route-object-include-exclude' list for a reverse path means it always follows the forward path (i.e., the TE Tunnel is co-routed). When the 'route-object-include-exclude' list is not empty, the reverse path is routed independently of the forward path.
- 4. An empty 'route-object-include-exclude' list for the secondary (forward) path indicates that the secondary path has the same endpoints as the primary path.

5.1.2. TE Tunnels

The 'tunnels' container holds the list of TE Tunnels that are provisioned on devices in the network (see Figure 5).

A TE Tunnel in the list is uniquely identified by a name. When the model is used to manage a specific device, the 'tunnels' list contains the TE Tunnels originating from the specific device. When the model is used to manage a TE controller, the 'tunnels' list contains all TE Tunnels and TE tunnel segments originating from device(s) that the TE controller manages.

The TE Tunnel model allows the configuration and management of the following TE tunnel related objected:

TE Tunnel:

A YANG container of one or more LSPs established between the source and destination TE Tunnel termination points. A TE Tunnel LSP is a connection-oriented service provided by the network layer

for the delivery of client data between a source and the destination of the TE Tunnel termination points.

TE Tunnel Segment:

A part of a multi-domain TE Tunnel that is within a specific network domain.

```
+--rw tunnels
 +--rw tunnel* [name]

Figure 5: TE Tunnel list YANG subtree structure

The TE Tunnel has a number of attributes that are set directly under the tunnel (see Figure 5). The main attributes of a TE Tunnel are described below:

Saad, et al. Expires January 9, 2022 [Page 13]

operational-state:

A YANG leaf that holds the operational state of the tunnel.

name:

A YANG leaf that holds the name of a TE Tunnel. The name of the TE Tunnel uniquely identifies the tunnel within the TE tunnel list. The name of the TE Tunnel can be formatted as a Uniform Resource Indicator (URI) by including the namespace to ensure uniqueness of the name amongst all the TE Tunnels present on devices and controllers.

alias:

A YANG leaf that holds an alternate name to the TE tunnel. Unlike the TE tunnel name, the alias can be modified at any time during the lifetime of the TE tunnel.

identifier:

A YANG leaf that holds an identifier of the tunnel. This identifier is unique amongst tunnels originated from the same ingress device.

color:

A YANG leaf that holds the color associated with the TE tunnel. The color is used to map or steer services that carry matching color on to the TE tunnel as described in [RFC9012].

encoding/switching:

The 'encoding' and 'switching-type' are YANG leafs that define the specific technology in which the tunnel operates in as described in [RFC3945].

reoptimize-timer:

A YANG leaf to set the inteval period for tunnel reoptimization.

source/destination:

YANG leafs that define the tunnel source and destination node endpoints.

src-tunnel-tp-id/dst-tunnel-tp-id:

YANG leafs that hold the identifiers of source and destination TE Tunnel Termination Points (TTPs) [RFC8795] residing on the source and destination nodes. The TTP identifiers are optional on nodes that have a single TTP per node. For example, TTP identifiers are optional for packet (IP/MPLS) routers.

controller:

A YANG container that holds tunnel data relevant to an optional external TE controller that may initiate or control a tunnel. This target node may be augmented by external module(s), for example, to add data for PCEP initiated and/or delegated tunnels.

bidirectional:

A YANG leaf that when present indicates the LSPs of a TE Tunnel are bidirectional and co-routed.

association-objects:

A YANG container that holds the set of associations of the TE Tunnel to other TE Tunnels. Associations at the TE Tunnel level apply to all paths of the TE Tunnel. The TE tunnel associations can be overridden by associations configured directly under the TE Tunnel path.

protection:

A YANG container that holds the TE Tunnel protection properties.

restoration:

A YANG container that holds the TE Tunnel restoration properties.

te-topology-identifier:

A YANG container that holds the topology identifier associated with the topology where paths for the TE tunnel are computed.

```
+--rw hierarchy
 +--rw dependency-tunnels
| | +--rw dependency-tunnel* [name]
        +--rw name
                -> ../../../tunnels/tunnel/name
       +--rw encoding?
                              identityref
        +--rw switching-type? identityref
  +--rw hierarchical-link
     +--rw local-te-node-id?
                                   te-types:te-node-id
     +--rw local-te-link-tp-id?
                                  te-types:te-tp-id

        +--rw provider-id? te-global-id
       +--rw client-id?
                          te-global-id
        +--rw topology-id? te-topology-id
```

Figure 6: TE Tunnel hierarchy YANG subtree

hierarchy:

A YANG container that holds hierarchy related properties of the TE Tunnel (see Figure 6. A TE LSP can be set up in MPLS or Generalized MPLS (GMPLS) networks to be used as a TE links to carry traffic in other (client) networks [RFC6107]. In this case, the model introduces the TE Tunnel hierarchical link endpoint parameters to identify the specific link in the client layer that the underlying TE Tunnel is associated with. The hierarchy container includes the following:

- + dependency-tunnels: A set of hierarchical TE Tunnels provisioned or to be provisioned in the immediate lower layer that this TE tunnel depends on for multi-layer path computation. A dependency TE Tunnel is provisioned if and only if it is used (selected by path computation) at least by one client layer TE Tunnel. The TE link in the client layer network topology supported by a dependent TE Tunnel is dynamically created only when the dependency TE Tunnel is actually provisioned.
- + hierarchical-link: A YANG container that holds the identity of the hierarchical link (in the client layer) that is supported by this TE Tunnel. The endpoints of the hierarchical link are defined by TE tunnel source and destination node endpoints. The hierarchical link can be

identified by its source and destination link termination point identifiers.

5.1.2.1. TE Tunnel Paths

The TE Tunnel can be configured with a set of paths that define the tunnel forward and reverse paths as described in Figure 7. Moreover, a primary path can be specified a set of candidate secondary paths that can be visited to support path protection. The following describe further the list of paths associated with a TE Tunnel.

```
+--rw primary-paths
    | +--rw primary-path* [name]
+--rw name
                                             string
// ..
         +--rw primary-reverse-path
         | +--rw name?
                                                    string
// ..
         +--rw candidate-secondary-reverse-paths
         +--rw candidate-secondary-reverse-path*
    [secondary-path]
                 +--rw secondary-path leafref
         +--rw candidate-secondary-paths
           +--rw candidate-secondary-path* [secondary-path]
               +--rw secondary-path leafref
+--ro active?
                                     boolean
     +--rw secondary-paths
| +--rw secondary-path* [name]
         +--rw name
                                             string
// ..
    +--rw secondary-reverse-paths
| +--rw secondary-reverse-path* [name]
+--rw name
                                             string
```

Figure 7: TE Tunnel paths YANG tree structure

primary-paths:

A YANG container that holds the list of primary paths. A primary path is identified by 'name'. A primary path is selected from the list to instantiate a primary forwarding LSP for the tunnel. The list of primary paths is visited by order of preference. A primary path has the following attributes:

Saad, et al. Expires January 9, 2022 [Page 17]

- * primary-reverse-path: A YANG container that holds properties of the primary reverse path. The reverse path is applicable to bidirectional TE Tunnels.
- * candidate-secondary-paths: A YANG container that holds a list of candidate secondary paths which may be used for the primary path to support path protection. The candidate secondary path(s) reference path(s) from the tunnel secondary paths list. The preference of the secondary paths is specified within the list and dictates the order of visiting the secondary path from the list. The attributes of a secondary path can be defined separately from the primary path. The attributes of a secondary path will be inherited from the associated 'active' primary when not explicitly defined for the secondary path.

secondary-paths:

A YANG container that holds the set of secondary paths. A secondary path is identified by 'name'. A secondary path can be referenced from the TE Tunnel's 'candidate-secondary-path' list. A secondary path contains attributes similar to a primary path.

secondary-reverse-paths:

A YANG container that holds teh set of secondary reverse paths. A secondary reverse path is identified by 'name'. A secondary reverse path can be referenced from the TE Tunnel's 'candidate-secondary-reverse-paths' list. A secondary reverse path contains attributes similar to a primary path.

The following set common path attributes are shared for primary forward and reverse primary and secondary paths:

compute-only:

A path of TE Tunnel is, by default, provisioned so that it can is instantiated in forwarding to carry traffic as soon as a valid path is computed. In some cases, a TE path may be provisioned for the only purpose of computing a path and reporting it without the need to instantiate the LSP or commit any resources. In such a case, the path is configured in 'compute-only' mode to distinguish it from the default behavior. A 'compute-only' path is configured as a usual with the associated per path constraint(s) and properties on a device or TE controller. The device or TE

controller computes the feasible path(s) subject to configured constraints. A client may query the 'compute-only' computed path properties 'on-demand', or alternatively, can subscribe to be notified of computed path(s) and whenever the path properties change.

use-path-computation:

A YANG leaf that indicates whether or not path computation is to be used for a specified path.

lockdown:

A YANG leaf that when set indicates the existing path should not be reoptimized after a failure on any of its traversed links.

te-topology-identifier:

A YANG container that holds the topology identifier associated with the tunnel.

optimizations:

a YANG container that holds the optimization objectives that path computation will use to select a path.

computed-paths-properties: > A YANG container that holds properties for the list of computed paths.

computed-path-error-infos:

A YANG container that holds a list of errors related to the path.

lsps:

a YANG container that holds a list of LSPs that are instantiated for this specific path.

<u>5.1.3</u>. TE LSPs

The 'lsps' container includes the set of TE LSP(s) that are instantiated. A TE LSP is identified by a 3-tuple ('tunnel-name', 'node', 'lsp-id').

When the model is used to manage a specific device, the 'lsps' list contains all TE LSP(s) that traverse the device (including ingressing, transiting and egressing the device).

When the model is used to manage a TE controller, the 'lsps' list contains all TE LSP(s) that traverse all network devices (including ingressing, transiting and egressing the device) that the TE controller manages.

5.2. Tree Diagram

Figure 8 shows the tree diagram of the generic TE YANG model defined in modules 'ietf-te.yang'.

Figure 8: TE Tunnel generic model YANG tree diagram

5.3. YANG Module

The generic TE YANG module 'ietf-te' imports the following modules:

- o ietf-yang-types and ietf-inet-types defined in [RFC6991]
- o ietf-te-types defined in [RFC8776]

```
This module references the following documents: [RFC6991], [RFC4875],
   [RFC7551], [RFC4206], [RFC4427], [RFC4872], [RFC3945], [RFC3209],
   [RFC6780], [RFC8800], and [RFC7308].

Figure 9: TE Tunnel data model YANG module

6. TE Device YANG Model

The device TE YANG module ('ietf-te-device') models data that is specific to managing a TE device. This module augments the generic TE YANG module.

Saad, et al. Expires January 9, 2022 [Page 98]

6.1. Module Structure

6.1.1. TE Interfaces

This branch of the model manages TE interfaces that are present on a device. Examples of TE interface properties are:

- o Maximum reservable bandwidth, bandwidth constraints (BC)
- o Flooding parameters
 - * Flooding intervals and threshold values
- o interface attributes
 - * (Extended) administrative groups
 - * SRLG values
 - * TE metric value
- o Fast reroute backup tunnel properties (such as static, autotunnel)

The derived state associated with interfaces is grouped under the interface "state" sub-container as shown in Figure 10. This covers state data such as:

- o Bandwidth information: maximum bandwidth, available bandwidth at different priorities and for each class-type (CT)
- o List of admitted LSPs
 - * Name, bandwidth value and pool, time, priority
- o Statistics: state counters, flooding counters, admission counters (accepted/rejected), preemption counters
- o Adjacency information
 - * Neighbor address
 - * Metric value

Figure 10: TE interface state YANG subtree

<u>6.2</u>. Tree Diagram

Figure 11 shows the tree diagram of the device TE YANG model defined in modules 'ietf-te.yang'.

Figure 12: TE device data model YANG module

7. Notifications

Notifications are a key component of any topology data model.

[RFC8639] and [RFC8641] define a subscription mechanism and a push mechanism for YANG datastores. These mechanisms currently allow the user to:

- o Subscribe to notifications on a per-client basis.
- o Specify subtree filters or XML Path Language (XPath) filters so that only contents of interest will be sent.
- o Specify either periodic or on-demand notifications.

8. TE Generic and Helper YANG Modules

9. IANA Considerations

This document registers the following URIs in the IETF XML registry $[\mbox{RFC3688}]$. Following the format in $[\mbox{RFC3688}]$, the following registrations are requested to be made.

```
URI: urn:ietf:params:xml:ns:yang:ietf-te
Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-te-device
Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.
```

This document registers two YANG modules in the YANG Module Names registry [RFC6020].

Name: ietf-te

Namespace: urn:ietf:params:xml:ns:yang:ietf-te

Prefix: te Reference: RFCXXXX

Name: ietf-te-device

Namespace: urn:ietf:params:xml:ns:yang:ietf-te-device

Prefix: te-device Reference: RFCXXXX

10. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer

Saad, et al. Expires January 9, 2022 [Page 117]

is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The Network Configuration Access Control Model (NACM) [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

"/te/globals": This module specifies the global TE configurations on a device. Unauthorized access to this container could cause the device to ignore packets it should receive and process.

"/te/tunnels": This list specifies the configured TE Tunnels on a device. Unauthorized access to this list could cause the device to ignore packets it should receive and process.

"/te/interfaces": This list specifies the configured TE interfaces on a device. Unauthorized access to this list could cause the device to ignore packets it should receive and process.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

"/te/lsps": this list contains information state about established LSPs in the network. An attacker can use this information to derive information about the network topology, and subsequently orchestrate further attacks.

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

"unnels-actions": using this RPC, an attacker can modify existing paths that may be carrying live traffic, and hence result to interruption to services carried over the network.

"/te/tunnels-path-compute": using this RPC, an attacker can retrieve secured information about the network provider which can be used to orchestrate further attacks.

The security considerations spelled out in the YANG 1.1 specification [RFC7950] apply for this document as well.

11. Acknowledgement

The authors would like to thank the members of the multi-vendor YANG design team who are involved in the definition of this model.

The authors would like to thank Tom Petch for reviewing and providing useful feedback about the document. The authors would also like to thank Loa Andersson, Lou Berger, Sergio Belotti, Italo Busi, Carlo Perocchio, Francesco Lazzeri, Aihua Guo, Dhruv Dhody, for providing useful feedback on this document.

13. Appendix A: Examples

This section contains examples of use of the model with RESTCONF [RFC8040] and JSON encoding.

For the example we will use a 4 nodes MPLS network were RSVP-TE Tunnels can be setup. The loopbacks of each router are shown. The router network in figure X will be used across the section

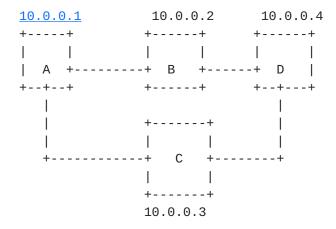

Figure 13: Example TE topology

13.1. Basic Tunnel Setup

This example uses the TE Tunnel YANG data model defined in this document to create an RSVP-TE signaled Tunnel. First, the TE Tunnel is created with no specific restrictions or constraints (e.g., protection or restoration). The TE Tunnel ingresses on router A and egresses on router D.

In this case, the TE Tunnel is created without specifying additional information about the primary paths.

13.2. Global Named Path Constraints

This example uses the YANG data model to create a 'named path constraint' that can be reference by TE Tunnels. The path constraint, in this case, limits the TE Tunnel hops for the computed path.

13.3. Tunnel with Global Path Constraint

In this example, the previously created 'named path constraint' is applied to the TE Tunnel created in <u>Section 13.1</u>.

Saad, et al. Expires January 9, 2022 [Page 121]

```
POST /restconf/data/ietf-te:te/tunnels HTTP/1.1
   Host: example.com
   Accept: application/yang-data+json
   Content-Type: application/yang-data+json
  "ietf-te:ietf-tunnel": [
      "name": "Example_LSP_Tunnel_A_4_1",
      "encoding": "te-types:lsp-encoding-packet",
      "description": "Simple_LSP_with_named_path",
      "admin-state": "te-types:tunnel-state-up",
      "source": "10.0.0.1",
      "destination": "10.0.0.4",
      "signaling-type": "path-setup-rsvp",
      "bidirectional": "false",
      "primary-paths": [
        {
          "primary-path": {
            "name": "Simple_LSP_1",
            "use-path-computation": "true",
            "named-path-constraint": "max-hop-3"
         }
        }
      ]
   }
 ]
}
```

13.4. Tunnel with Per-tunnel Path Constraint

In this example, the a per tunnel path constraint is explicitly indicated under the TE Tunnel created in <u>Section 13.1</u> to constrain the computed path for the tunnel.

POST /restconf/data/ietf-te:te/tunnels HTTP/1.1

Host: example.com

following json:

```
Accept: application/yang-data+json
       Content-Type: application/yang-data+json
     "ietf-te:tunnel": [
         "name": "Example_LSP_Tunnel_A_4_2",
         "encoding": "te-types:lsp-encoding-packet",
         "admin-state": "te-types:tunnel-state-up",
         "source": "10.0.0.1",
         "destination": "10.0.0.4",
         "bidirectional": "false",
         "signaling-type": "te-types:path-setup-rsvp",
         "primary-paths": {
           "primary-path": [
             {
               "name": "path1",
               "path-metric-bounds": {
                 "path-metric-bound": [
                   {
                     "metric-type": "te-types:path-metric-hop",
                     "upper-bound": "3"
                   }
                 ]
               }
             }
           ]
        }
       }
     ]
   }
13.5. Tunnel State
   In this example, the 'GET' query is sent to return the state stored
   about the tunnel.
GET /restconf/data/ietf-te:te/tunnels/tunnel="Example_LSP_Tunnel_A_4_1"
     /p2p-primary-paths/ HTTP/1.1
    Host: example.com
   Accept: application/yang-data+json
```

The request, with status code 200 would include, for example, the

```
{
  "ietf-te:primary-paths": {
    "primary-path": [
        "name": "path1",
        "path-computation-method": "te-types:path-locally-computed",
        "computed-paths-properties": {
          "computed-path-properties": [
            {
              "k-index": "1",
              "path-properties": {
                "path-route-objects": {
                  "path-route-object": [
                    {
                      "index": "1",
                      "numbered-node-hop": {
                         "node-id": "10.0.0.2"
                      }
                    },
                      "index": "2",
                      "numbered-node-hop": {
                        "node-id": "10.0.0.4"
                      }
                    }
                  ]
                }
              }
            }
          ]
        },
        "lsps": {
          "lsp": [
            {
              "tunnel-name": "Example_LSP_Tunnel_A_4_1",
              "node": "10.0.0.1 ",
              "lsp-id": "25356"
            }
        }
     }
    ]
 }
