YANG Data Model for TE Topologies
draft-ietf-teas-yang-te-topo-03

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at
<http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at
<http://www.ietf.org/shadow.html>

This Internet-Draft will expire on September 20, 2016.

Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the [Trust Legal Provisions](#) and are provided without warranty as described in the Simplified BSD License.

Abstract

This document defines a YANG data model for representing, retrieving and manipulating TE Topologies. The model serves as a base model that other technology specific TE Topology models can augment.

Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC-2119](#) [[RFC2119](#)].

[1. Introduction](#)

The Traffic Engineering Database (TED) is an essential component of Traffic Engineered (TE) systems that are based on MPLS-TE [[RFC2702](#)] and GMPLS [[RFC3945](#)]. The TED is a collection of all TE information about all TE nodes and TE links in the network. The TE Topology is a schematic arrangement of TE nodes and TE links present in a given TED. There could be one or more TE Topologies present in a given Traffic Engineered system. The TE Topology is the topology on which path computational algorithms are run to compute Traffic Engineered Paths (TE Paths).

This document defines a YANG [[RFC6020](#)] data model for representing and manipulating TE Topologies. This model contains technology agnostic TE Topology building blocks that can be augmented and used by other technology-specific TE Topology models.

1.1. Terminology

TED: The Traffic Engineering Database is a collection of all TE information about all TE nodes and TE links in a given network.

TE-Topology: The TE Topology is a schematic arrangement of TE nodes and TE links in a given TED. It forms the basis for a graph suitable for TE path computations.

Native TE Topology: Native TE Topology is a topology that is native to a given provider network. Native TE topology could be discovered via various routing protocols and/or subscribe/publish techniques. This is the topology on which path computational algorithms are run to compute TE Paths.

Customized TE Topology: Customized TE Topology is a custom topology that is produced by a provider for a given Client. This topology typically augments the Client's Native TE Topology. Path computational algorithms aren't typically run on the Customized TE Topology; they are run on the Client's augmented Native TE Topology.

1.2. Tree Structure - Legend

A simplified graphical representation of the data model is presented in [Section 6](#). of this document. The following notations are used for the YANG model data tree representation.

```
<status> <flags> <name> <opts> <type>

<status> is one of:
+ for current
x for deprecated
o for obsolete

<flags> is one of:
rw for read-write configuration data
ro for read-only non-configuration data
-x for execution rpcs
-n for notifications
```

<name> is the name of the node

If the node is augmented into the tree from another module, its name is printed as <prefix>:<name>

<opts> is one of:

? for an optional leaf or node
! for a presence container
* for a leaf-list or list
Brackets [<keys>] for a list's keys
Curly braces {<condition>} for optional feature that make node conditional

Colon : for marking case nodes
Ellipses ("...") subtree contents not shown

Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (:).

<type> is the name of the type for leafs and leaf-lists.

1.3. Prefixes in Data Node Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in Table 1.

Prefix	YANG module	Reference
yang	ietf-yang-types	[RFC6991]
inet	ietf-inet-types	[RFC6991]

Table 1: Prefixes and corresponding YANG modules

2. Characterizing TE Topologies

The data model proposed by this document takes the following characteristics of TE Topologies into account:

- TE Topology is an abstract control-plane representation of the data-plane topology. Hence attributes specific to the data-plane must make their way into the corresponding TE Topology modeling. The TE Topology comprises of dynamic auto-discovered data (data that may change frequently - example: unreserved bandwidth available on data-plane links) as well as fairly static data (data that rarely changes- examples: layer network identification, switching and adaptation capabilities and limitations, fate sharing, administrative colors) associated with data-plane nodes and links. It is possible for a single TE Topology to encompass TE information at multiple switching layers.

- TE Topologies are protocol independent. Information about topological elements may be learnt via link-state protocols, but the topology can exist without being dependent on any particular protocol.
- TE Topology may not be congruent to the routing topology (topology constructed based on routing adjacencies) in a given TE System. There isn't always a one-to-one association between a TE-link and a routing adjacency. For example, the presence of a TE link between a pair of nodes doesn't necessarily imply the existence of a routing-adjacency between these nodes.
- Each TE Topological element has an information source associated with it. In some scenarios, there could be more than one information source associated with each topological element.
- TE Topologies can be hierarchical. Each node and link of a given TE Topology can be associated with respective underlay topology. This means that each node and link of a given TE Topology can be associated with an independent stack of supporting TE Topologies.
- TE Topologies can be customized. TE topologies of a given network presented by the network provider to its client could be customized on per-client request basis. This customization could be performed by provider, by client or by provider/client negotiation. The relationship between a customized topology (as presented to the client) and provider's native topology (as known in its entirety to the provider itself) could be captured as hierarchical (overlay-underlay), but otherwise the two topologies are decoupled from each other.

3. Modeling Abstractions and Transformations

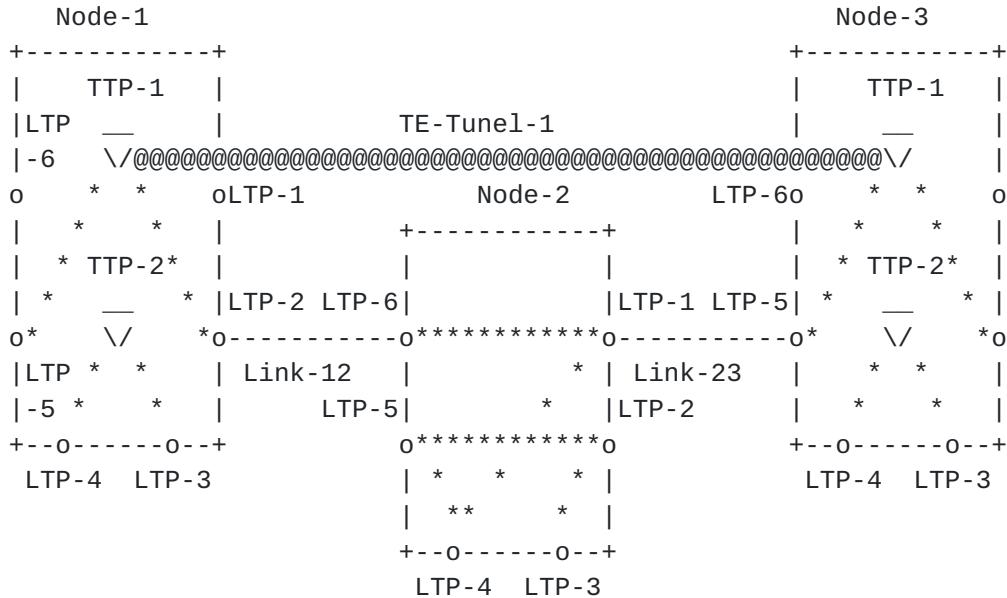

Figure 1: TE Topology Modeling Abstractions

3.1. TE Topology

TE topology is a traffic engineering representation of one or more layers of network topologies. TE topology is comprised of TE nodes (TE graph vertices) interconnected via TE links (TE graph edges). A TE topology is mapped to a TE graph.

3.2. TE Node

TE node is an element of a TE topology (presented as a vertex on TE graph). TE node represents one or several nodes (physical switches), or a fraction of a node. TE node belongs to and is fully defined in exactly one TE topology. TE node is assigned with the TE topology scope unique ID. TE node attributes include information related to the data plane aspects of the associated node(s) (e.g. connectivity matrix), as well as configuration data (such as TE node name). A given TE node can be reached on the TE graph over one of TE links terminated by the TE node.

In Figure 1, Node-1, Node-2, and Node-3 are TE nodes.

3.3. TE Link

TE link is an element of a TE topology (presented as an edge on TE graph, arrows indicate one or both directions of the TE link). TE link represents one or several (physical) links or a fraction of a link. TE link belongs to and is fully defined in exactly one TE topology. TE link is assigned with the TE topology scope unique ID. TE link attributes include parameters related to the data plane aspects of the associated link(s) (e.g. unreserved bandwidth, resource maps/pools, etc.), as well as the configuration data (such as remote node/link IDs, SRLGs, administrative colors, etc.). TE link is connected to TE node, terminating the TE link via exactly one TE link termination point (LTP).

In Figure 1, Link-12 and Link-23 are TE links.

3.4. TE Link Termination Point (LTP)

TE link termination point (LTP) is a conceptual point of connection of a TE node to one of the TE links, terminated by the TE node. Cardinality between an LTP and the associated TE link is 1:0..1.

In Figure 1, Node-2 has six LTPs: LTP-1 to LTP-6.

3.5. TE Tunnel Termination Point (TTP)

TE tunnel termination point (TTP) is an element of TE topology representing one or several of potential transport service termination points (i.e. service client adaptation points such as WDM/OCh transponder). TTP is associated with (hosted by) exactly one TE node. TTP is assigned with the TE node scope unique ID. Depending on the TE node's internal constraints, a given TTP hosted by the TE node could be accessed via one, several or all TE links terminated by the TE node.

In Figure 1, Node-1 has two TTPs: TTP-1 and TTP-2.

3.6. TE Node Connectivity Matrix

TE node connectivity matrix is a TE node's attribute describing the TE node's switching limitations in a form of valid switching combinations of the TE node's LTPs (see below). From the point of view of a potential TE path arriving at the TE node at a given inbound LTP, the node's connectivity matrix describes valid (permissible) outbound LTPs for the TE path to leave the TE node from.

In Figure 1, the connectivity matrix on Node-2 is:

{<LTP-6, LTP-1>, <LTP-5, LTP-2>, <LTP-5, LTP-4>, <LTP-4, LTP-1>, <LTP-3, LTP-2>}

3.7. TTP Local Link Connectivity List (LLCL)

TTP Local Link Connectivity List (LLCL) is a List of TE links terminated by the TTP hosting TE node (i.e. list of the TE link LTPs), which the TTP could be connected to. From the point of view of a potential TE path LLCL provides a list of valid TE links the TE path needs to start/stop on for the connection, taking the TE path, to be successfully terminated on the TTP in question.

In Figure 1, the LLCL on Node-1 is:

{<TTP-1, LTP-5>, <TTP-1, LTP-2>, <TTP-2, LTP-3>, <TTP-2, LTP4>}

3.8. TE Path

TE path is an ordered list of TE links and/or TE nodes on the TE topology graph, inter-connecting a pair of TTPs to be taken by a potential connection. TE paths, for example, could be a product of successful path computation performed for a given transport service.

In Figure 1, the TE Path for TE-Tunnel-1 is:

{Node-1:TTP-1, Link-12, Node-2, Link-23, Node-3:TTP1}

3.9. Underlay TE topology

Underlay TE topology is a TE topology that serves as a base for constructing of overlay TE topologies

3.10. Overlay TE topology

Overlay TE topology is a TE topology constructed based on one or more underlay TE topologies. Each TE node of the overlay TE topology represents an arbitrary segment of an underlay TE topology; each TE link of the overlay TE topology represents an arbitrary TE path in one of the underlay TE topologies. The overlay TE topology and the supporting underlay TE topologies may represent distinct layer networks (e.g. OTN/ODUK and WDM/OCh respectively) or the same layer network.

3.11. Abstract TE topology

Abstract TE topology is an overlay TE topology created by a topology provider and customized for a topology provider's client based on

one or more of the provider's native TE topologies (underlay TE topologies), the provider's policies and the client's preferences. For example, a first level topology provider (such as Domain Controller) can create an abstract TE topology for its client (e.g. Super Controller) based on the provider's one or more native TE topologies, local policies/profiles and the client's TE topology configuration requests

Figure 2 shows an example of abstract TE topology.

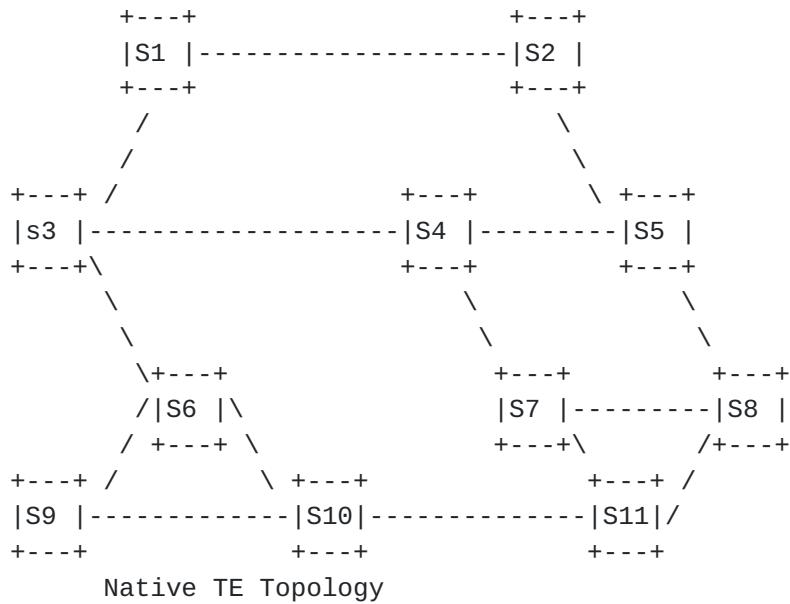

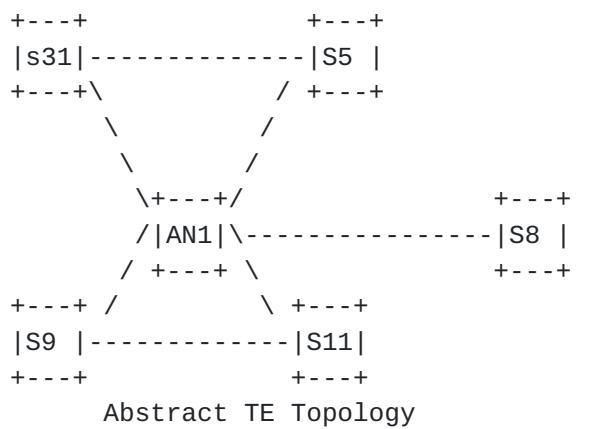

Figure 2: Abstract TE Topology

[4. Model Applicability](#)

[4.1. Native TE Topologies](#)

The model discussed in this draft can be used to represent and retrieve native TE topologies on a given TE system.

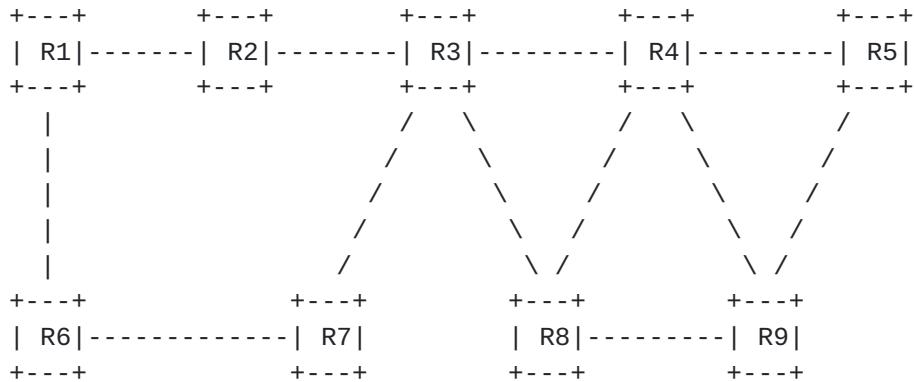

Figure 3a: Example Network Topology

Consider the network topology depicted in Figure 3a (R1 .. R9 are nodes representing routers). An implementation MAY choose to construct a native TE Topology using all nodes and links present in the given TED as depicted in Figure 3b. The data model proposed in this document can be used to retrieve/represent this TE topology.

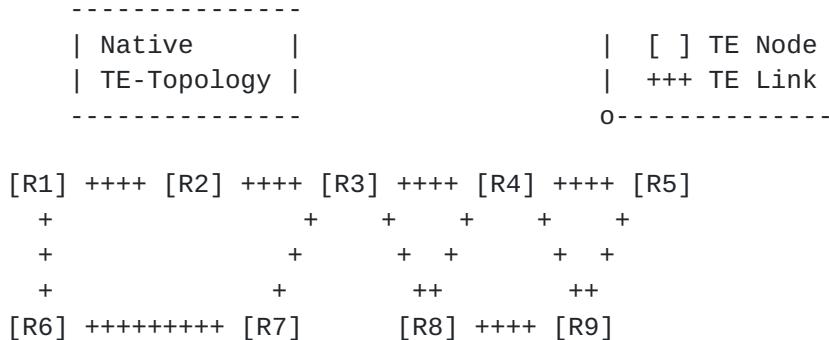

Figure 3b: Native TE Topology as seen on Node R3

Consider the case of the topology being split in a way that some nodes participate in OSPF-TE while others participate in ISIS-TE (Figure 4a). An implementation MAY choose to construct separate TE Topologies based on the information source. The native TE Topologies constructed using only nodes and links that were learnt via a specific information source are depicted in Figure 4b. The data model proposed in this document can be used to retrieve/represent these TE topologies.

Similarly, the data model can be used to represent/retrieve a TE Topology that is constructed using only nodes and links that belong to a particular technology layer. The data model is flexible enough to retrieve and represent many such native TE Topologies.

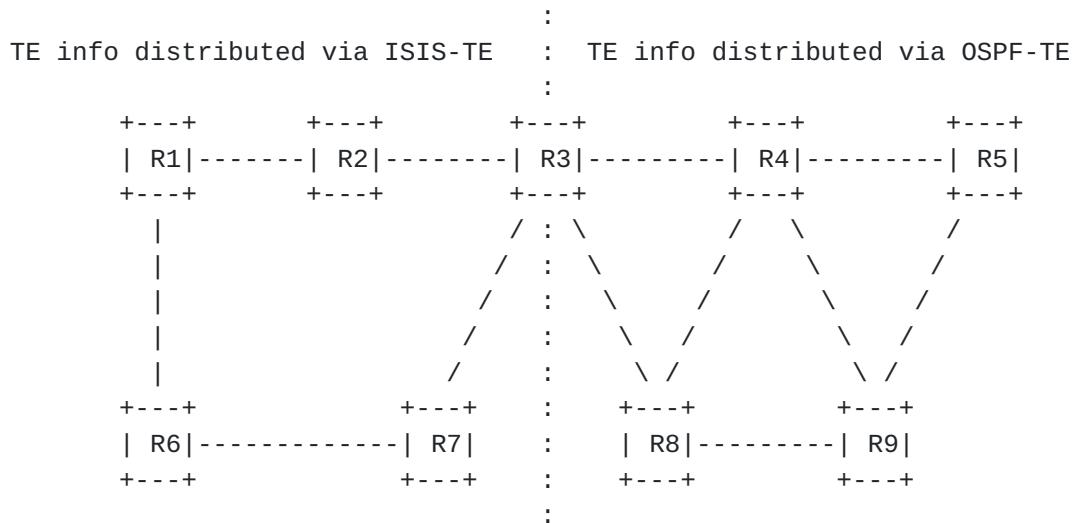

Figure 4a: Example Network Topology

Native TE Topology	:	Native TE Topology
Info-Source: ISIS-TE	:	Info-Source: OSPF-TE
-----	:	-----
	:	
[R1] +++++ [R2] +++++ [R3]	:	[R3'] +++++ [R4] +++++ [R5]
+	+	+
+	+	+
+	+	++
[R6] ++++++++ [R7]	:	[R8] +++++ [R9]
	:	

Figure 4b: Native TE Topologies as seen on Node R3

4.2. Customized TE Topologies

The model discussed in this draft can be used to represent, retrieve and manipulate customized TE Topologies. The model allows the provider to present the network in abstract TE Terms on a per client basis. These customized topologies contain sufficient information for the path computing client to select paths according to its policies.

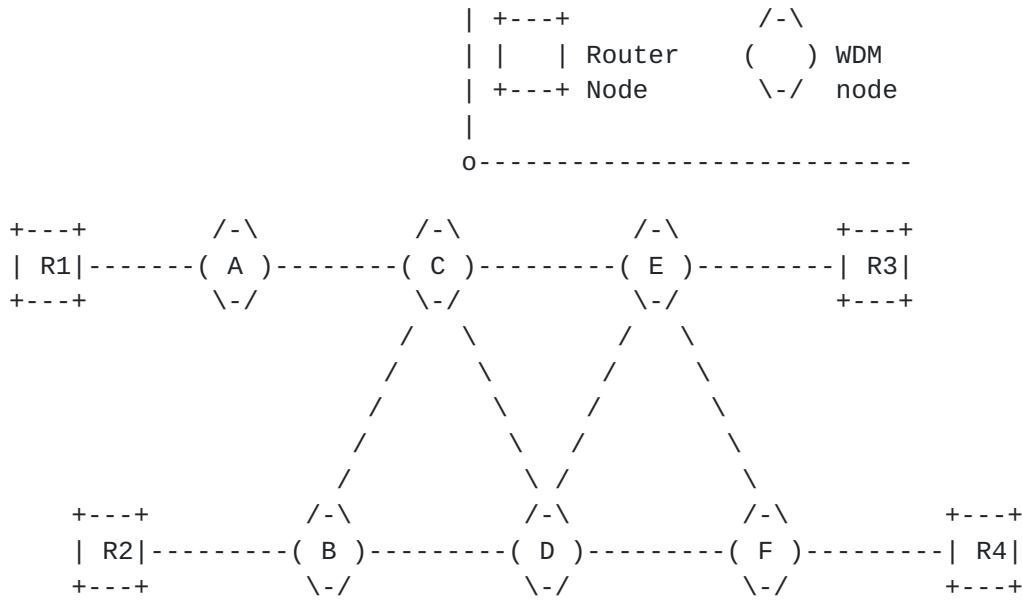

Figure 5: Example packet optical topology

Consider the network topology depicted in Figure 5. This is a typical packet optical transport deployment scenario where the WDM layer network domain serves as a Server Network Domain providing transport connectivity to the packet layer network Domain (Client Network Domain). Nodes R1, R2, R3 and R4 are IP routers that are connected to an Optical WDM transport network. A, B, C, D, E and F are WDM nodes that constitute the Server Network Domain.

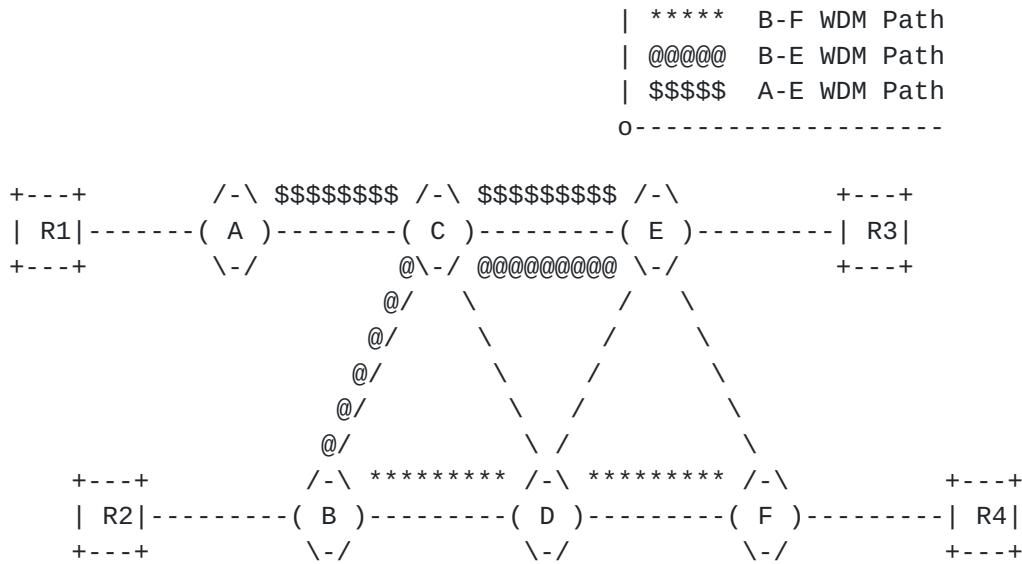

Figure 6a: Paths within the provider domain

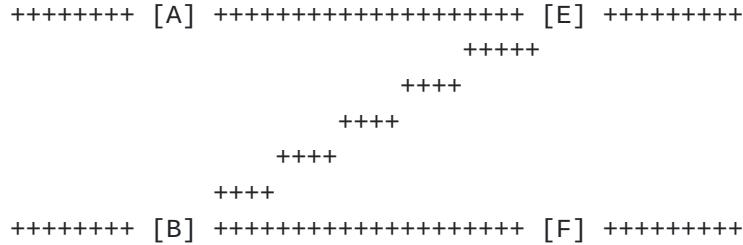

Figure 6b: Customized TE Topology provided to the Client

The goal here is to augment the Client TE Topology with a customized TE Topology provided by the WDM network. Given the availability of the paths A-E, B-F and B-E (Figure 6a), a customized TE Topology as depicted in Figure 6b is provided to the Client. This customized TE Topology is merged with the Client's Native TE Topology and the resulting topology is depicted in Figure 6c.

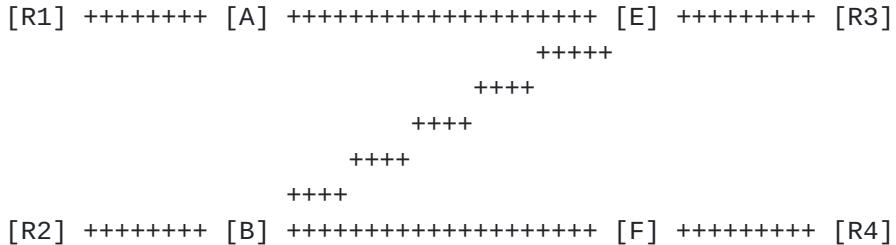

Figure 6c: Customized TE Topology merged with the Client's Native TE Topology

The data model proposed in this document can be used to retrieve/represent/manipulate the customized TE Topology depicted in Figure 6b.

5. Modeling Considerations

5.1. Generic network topology building blocks

The generic network topology building blocks are discussed in [YANG-NET-TOPO]. The TE Topology model proposed in this document augments and uses the ietf-network-topology module defined in [YANG-NET-TOPO].

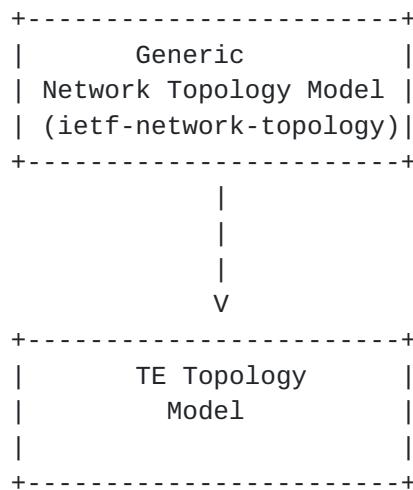

Figure 7: Augmenting the Generic Network Topology Model

[5.2.](#) Technology agnostic TE Topology model

The TE Topology model proposed in this document is meant to be technology agnostic. Other technology specific TE Topology models can augment and use the building blocks provided by the proposed model.

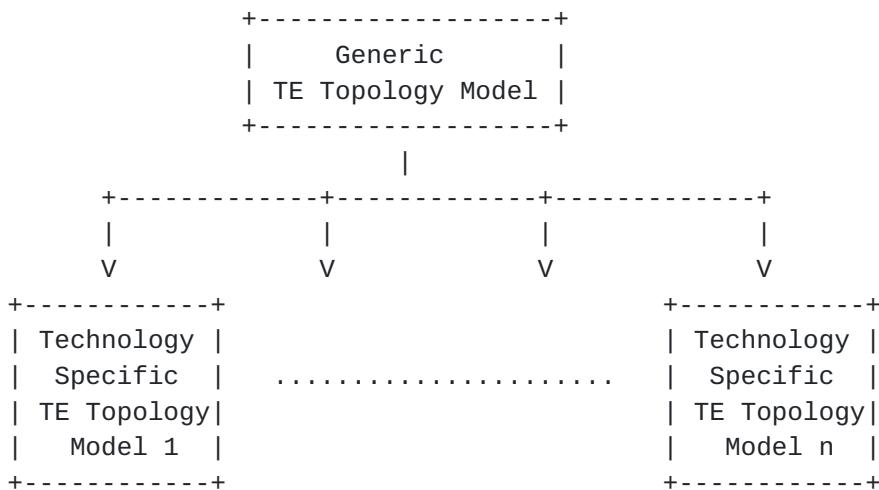

Figure 8: Augmenting the Technology agnostic TE Topology model

[5.3.](#) Model Structure

The high-level model structure proposed by this document is as shown below:

```
module: ietf-te-topology
augment /nw:networks/nw:network/nw:network-types:
  +-+rw te-topology!

augment /nw:networks:
  +-+rw te!
    +-+rw templates
      +-+rw node-template* [name] {template}?
      | .....
      +-+rw link-template* [name] {template}?
      .....

augment /nw:networks/nw:network:
  +-+rw te!
    +-+rw provider-id      te-global-id
    +-+rw client-id        te-global-id
    +-+rw te-topology-id   te-topology-id
    +-+rw config
    | .....
    +-+ro state
    .....

augment /nw:networks/nw:network/nw:node:

    +-+rw te-tp-id      te-tp-id
    +-+rw config
```

```

| .....
+--ro state
.....
notifications:
+--n te-node-event
| .....
+--n te-link-event
.....

```

[5.4. Topology Identifiers](#)

The TE-Topology is uniquely identified by a key that has 3 constituents - te-topology-id, provider-id and client-id. The combination of provider-id and te-topology-id uniquely identifies a native TE Topology on a given provider. The client-id is used only when Customized TE Topologies come into play; a value of "0" is used as the client-id for native TE Topologies.

```

augment /nw:networks/nw:network:
+--rw te!
  +--rw provider-id      te-global-id
  +--rw client-id        te-global-id
  +--rw te-topology-id   te-topology-id

```

[5.5. Generic TE Link Attributes](#)

The model covers the definitions for generic TE Link attributes - bandwidth, admin groups, SRLGs, switching capabilities, TE metric extensions etc.

```

+--rw te-link-attributes
.....
+--rw admin-status?              te-admin-status
+--rw performance-metric-throttle {te-performance-metric}?
| .....
+--rw link-index?                uint64
+--rw administrative-group?      te-types:admin-groups
+--rw max-link-bandwidth?        decimal64
+--rw max-resv-link-bandwidth?   decimal64
+--rw unreserved-bandwidth* [priority]
| .....
+--rw te-default-metric?         uint32
+--rw performance-metric {te-performance-metric}?
| .....
+--rw link-protection-type?     enumeration

```

```

++-rw interface-switching-capability* [switching-capability]
| .....
+-rw te-srlgs
.....

```

[5.6. Generic TE Node Attributes](#)

The model covers the definitions for generic TE Node attributes.

The definition of a generic connectivity matrix is shown below:

```

+-rw te-node-attributes
.....
+-rw connectivity-matrix* [id]
| +-rw id          uint32
| +-rw from
| | +-rw tp-ref?   leafref
| +-rw to
| | +-rw tp-ref?   leafref
| +-rw is-allowed? boolean

```

The definition of a TTP Local Link Connectivity List is shown below:

```

+-rw tunnel-termination-point* [tunnel-tp-id]
  +-rw tunnel-tp-id    binary
  +-rw config
    +-rw termination-capability* [link-tp]
      +-rw link-tp      leafref
  +-ro state
    +-ro termination-capability* [link-tp]
      +-ro link-tp      leafref
    +-ro switching-capability   identityref
    +-ro encoding           identityref

```

[5.7. TED Information Sources](#)

The model allows each TE topological element to have multiple TE information sources (OSPF-TE, ISIS-TE, BGP-LS, User-Configured, System-Processed, Other). Each information source is associated with a credibility preference to indicate precedence. In scenarios where a customized TE Topology is merged into a Client's native TE Topology, the merged topological elements would point to the corresponding customized TE Topology as its information source.

```

augment /nw:networks/nw:network/nw:node:
  +-rw te!
    .....
    +-ro state
      .....
      +-ro information-source?          enumeration
      +-ro information-source-state
        +-ro credibility-preference?  uint16
        +-ro topology
        | +-ro provider-id-ref?       leafref
        | +-ro client-id-ref?        leafref
        | +-ro te-topology-id-ref?   leafref
        | +-ro network-id-ref?      leafref
        +-ro routing-instance?       string

augment /nw:networks/nw:network/nt:link:
  +-rw te!
    .....
    +-ro state
      .....
      +-ro information-source?          enumeration
      +-ro information-source-state
      | +-ro credibility-preference?  uint16
      | +-ro topology
      | | +-ro provider-id-ref?       leafref
      | | +-ro client-id-ref?        leafref
      | | +-ro te-topology-id-ref?   leafref
      | | +-ro network-id-ref?      leafref
      | +-ro routing-instance?       string
      +-ro alt-information-sources* [information-source]
      | .....

```

[5.8. Overlay/Underlay Relationship](#)

The model captures overlay and underlay relationship for TE nodes/links. For example - in networks where multiple TE Topologies are built hierarchically, this model allows the user to start from a specific topological element in the top most topology and traverse all the way down to the supporting topological elements in the bottom most topology.

This relationship is captured via the "underlay-topology" field for the node and via the "underlay" field for the link. The use of these fields is optional and this functionality is tagged as a "feature" ("te-topology-hierarchy").

```
augment /nw:networks/nw:network/nw:node:  
  +-rw te!  
    +-rw te-node-id      te-node-id  
    +-rw config  
      | +-rw te-node-template*   leafref {template}?  
      | +-rw te-node-attributes  
      | .....  
      | +-rw underlay-topology {te-topology-hierarchy}?  
      |   +-rw provider-id-ref?  leafref  
      |   +-rw client-id-ref?    leafref  
      |   +-rw te-topology-id-ref? leafref  
      |   +-rw network-id-ref?   leafref  
  
augment /nw:networks/nw:network/nt:link:  
  +-rw te!  
    +-rw config  
      | .....  
      | +-rw te-link-attributes  
      | .....  
      | +-rw underlay! {te-topology-hierarchy}?  
      |   +-rw underlay-primary-path  
      |   | +-rw provider-id-ref?  leafref  
      |   | +-rw client-id-ref?    leafref  
      |   | +-rw te-topology-id-ref? leafref  
      |   | +-rw network-id-ref?   leafref  
      |   | +-rw path-element* [path-element-id]  
      |   | .....  
      |   | +-rw underlay-backup-path* [index]  
      |   |   +-rw index          uint32  
      |   |   +-rw provider-id-ref? leafref  
      |   |   +-rw client-id-ref?  leafref  
      |   |   +-rw te-topology-id-ref? leafref  
      |   |   +-rw network-id-ref?  leafref  
      |   |   +-rw path-element* [path-element-id]  
      |   | .....  
      |   +-rw underlay-protection-type?  uint16  
    +-rw underlay-trail-src  
      | .....  
      |   +-rw network-ref?  leafref  
    +-rw underlay-trail-des  
      | .....
```

5.9. Scheduling Parameters

The model allows time scheduling parameters to be specified for each topological element or for the topology as a whole. These parameters allow the provider to present different topological views to the client at different time slots. The use of "scheduling parameters" is optional and this functionality is tagged as a "feature" ("configuration-schedule"). The YANG data model for configuration scheduling is defined in [[YANG-SCHEDULE](#)] and imported by the TE Topology module.

5.10. Templates

The data model provides the users with the ability to define templates and apply them to link and node configurations. The use of "template" configuration is optional and this functionality is tagged as a "feature" ("template").

```

++-rw topology* [provider-id client-id te-topology-id]
|   .....
|   +-rw node* [te-node-id]
|   |   +-rw te-node-template?      leafref {template}?
|   |   .....
|   +-rw link* [source-te-node-id source-te-link-id dest-te-node-
id dest-te-link-id]
|       +-rw te-link-template?      leafref {template}?

```

Multiple templates can be specified to a configuration element. When two or more templates specify values for the same configuration field, the value from the template with the highest priority is used. The reference-change-policy specifies the action that needs to be taken when the template changes on a configuration element that

has a reference to this template. The choices of action include taking no action, rejecting the change to the template and applying the change to the corresponding configuration. [Editor's Note: The notion of "templates" has wider applicability. It is possible for this to be discussed in a separate document.]

5.11. Notifications

Notifications are a key component of any topology data model.

[YANG-PUSH] defines a subscription and push mechanism for YANG datastores. This mechanism currently allows the user to:

- Subscribe notifications on a per client basis
- Specify subtree filters or xpath filters so that only interested contents will be sent.
- Specify either periodic or on-demand notifications.

The authors would like to recommend the use of this mechanism for the TE-Topology notifications. They would also like to suggest the following extensions to [[YANG-PUSH](#)]

- Specify specific entities that will trigger the push notifications. These entities can be specified by xpath, like the way a filter is specified.
- Specify or limit the triggering event type, e.g. "add", "delete", "modify", or "all". The system sends the push notifications only when such events happen on the triggering entities.
- Have an option to request either "incremental" or "full" notifications for an entity. For "incremental", the notification will contain only the changed attributes.

5.12. Open Items

- Coordinating changes to [[YANG-PUSH](#)]: The changes to [[YANG-PUSH](#)] discussed in [Section 4.10](#) will need to be coordinated with the authors of that draft.

6. Tree Structure

6.1. Base TE Topology Module

module: ietf-te-topology

8. Security Considerations

The transport protocol used for retrieving/manipulating the TE topology data MUST support authentication and SHOULD support encryption. The data-model by itself does not create any security implications.

9. IANA Considerations

This document registers the following URIs in the IETF XML registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration is requested to be made.

URI: urn:ietf:params:xml:ns:yang:ietf-te-topology
XML: N/A, the requested URI is an XML namespace.

This document registers a YANG module in the YANG Module Names registry [[RFC6020](#)].

name: ietf-te-topology
namespace: urn:ietf:params:xml:ns:yang:ietf-te-topology
prefix: tet
