**Russian Dolls Bandwidth Constraints Model for
Diff-Serv-aware MPLS Traffic Engineering**

Status of this Memo

Abstract

  This document provides specification for one Bandwidth Constraints
  model for Diff-Serv-aware MPLS Traffic Engineering, which is referred
  to as the Russian Dolls Model.

Summary for Sub-IP related Internet Drafts

  RELATED DOCUMENTS:
  draft-ietf-tewg-diff-te-reqts-07.txt
  draft-ietf-tewg-diff-te-proto-04.txt

  WHERE DOES IT FIT IN THE PICTURE OF THE SUB-IP WORK
  This ID is a Working Group document of the TE Working Group.

  WHY IS IT TARGETED AT THIS WG(s)
  TEWG is responsible for specifying protocol extensions for support of

JUSTIFICATION
The TEWG charter states that "This will entail verification and
review of the Diffserv requirements in the WG Framework document and
initial specification of how these requirements can be met through
use and potentially expansion of existing protocols."
In line with this, the TEWG is specifying bandwidth constraints model
for Diff-Serv-aware MPLS Traffic Engineering. This document describes
one particular bandwidth constraints model.

Specification of Requirements

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
"SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
document are to be interpreted as described in [RFC2119].

1.   Introduction

[DSTE-REQ] presents the Service Providers requirements for support of
Diff-Serv-aware MPLS Traffic Engineering (DS-TE). This includes the
fundamental requirement to be able to enforce different bandwidth
constraints for different classes of traffic.

[DSTE-REQ] also defines the concept of Bandwidth Constraint Models
for DS-TE and states that "The DS-TE technical solution MUST specify
at least one bandwidth constraint model and MAY specify multiple
bandwidth constraint."

This document provides a detailed description of one particular
Bandwidth Constraint model for DS-TE which is introduced in [DSTE-
REQ] and called the Russian Dolls Model (RDM).

[DSTE-PROTO] specifies the IGP and RSVP-TE signaling extensions for
support of DS-TE. These extensions support RDM.

[3]. Definitions

For readability a number of definitions from [DSTE-REQ] are repeated here:

Class-Type (CT): the set of Traffic Trunks crossing a link that is governed by a specific set of Bandwidth Constraints. CT is used for the purposes of link bandwidth allocation, constraint based routing

and admission control. A given Traffic Trunk belongs to the same CT
on all links.

TE-Class: A pair of:
   i. a Class-Type
  ii. a preemption priority allowed for that Class-Type. This
      means that an LSP transporting a Traffic Trunk from
      that Class-Type can use that preemption priority as the
      set-up priority, as the holding priority or both.

A number of recovery mechanisms under investigation or specification
in the IETF take advantage of the concept of bandwidth sharing across
particular sets of LSPs. "Shared Mesh Restoration" in [GMPLS-RECOV]
and "Facility-based Computation Model" in [MPLS-BACKUP] are example
mechanisms which increase bandwidth efficiency by sharing bandwidth
across backup LSPs protecting against independent failures. To ensure
that the notion of "Reserved (CTc)" introduced in [DSTE-REQ] is
compatible with such a concept of bandwidth sharing across multiple
LSPs, the wording of the "Reserved (CTc)" definition provided in
[DSTE-REQ] is generalized into the following:

Reserved (CTc): For a given Class-Type CTc ($0 <= c <= MaxCT$) ,let
us define "Reserved(CTc)" as the total amount of the bandwidth
reserved by all the established LSPs which belong to CTc.

With this generalization, the Russian Dolls Model definition provided
in this document is compatible with Shared Mesh Restoration defined

in [GMPLS-RECOV], so that DS-TE and Shared Mesh Protection can
operate simultaneously, under the assumption that Shared Mesh
Restoration operates independently within each DS-TE Class-Type and
does not operate across Class-Types (for example back up
LSPs protecting Primary LSPs of CTx must also belong to CTx; Excess
Traffic LSPs sharing bandwidth with Backup LSPs of CTx must also
belong to CTx).

We also introduce the following definition:

Reserved(CTb,q) : let us define "Reserved(CTb,q)" as the total amount

of the bandwidth reserved by all the established LSPs which belong to
CTb and have a holding priority of q. Note that if q and CTb do not
form one of the 8 possible configured TE-Classes, then there can not
be any established LSP which belong to CTb and have a holding
priority of q, so in that case, Reserved(CTb,q)=0.

[4]. **Russian Dolls Model Definition**

RDM is defined in the following manner:
        o Maximum Number of Bandwidth Constraints (MaxBC)=
          Maximum Number of Class-Types (MaxCT) = 8
        o for each value of b in the range 0 <= b <= (MaxCT - 1):
                SUM (Reserved (CTc)) <= BCb,
                Where the SUM is across all values of c in the
                range b <= c <= (MaxCT - 1)
        o BC0= Maximum Reservable Bandwidth, so that
                SUM (Reserved(CTc)) <= Max-Reservable-Bw,
                 where the SUM is across all values of c in the
                 range 0 <= c <= (MaxCT - 1)

A DS-TE LSR implementing RDM MUST support enforcement of bandwidth
constraints in compliance with this definition.

Both preemption within a Class-Type and across Class-Types is
allowed.

Where 8 Class-Types are active, the RDM bandwidth constraints can
also be expressed in the following way:
        - All LSPs from CT7 use no more than BC7
        - All LSPs from CT6 and CT7 use no more than BC6
        - All LSPs from CT5, CT6 and CT7 use no more than BC5
        - etc.
        - All LSPs from CT0, CT1,... CT7 use no more than
          BC0 = "Maximum Reservable Bandwidth"

Purely for illustration purposes, the diagram below represents the
Russian Doll Bandwidth Constraints model in a pictorial manner when 3
Class-Types are active:

```
I-------------------------------------------------------I
I------------------------------I                        I
I-------------I                I                        I
I    CT2      I    CT2+CT1     I      CT2+CT1+CT0        I
I-------------I                I                        I
I------------------------------I                        I
I-------------------------------------------------------I

I-----BC2------>
I---------------------BC1------>
I---------------------------BC0=Max Reservable Bw--->
```

While simpler Bandwidth Constraints models or, conversely, more
flexible/sophisticated Bandwidth Constraints models can be defined,
the Russian Dolls Model is attractive in some DS-TE environments for
the following reasons:
     - Although a little less intuitive than the Maximum Allocation
       Model (see[DSTE-MAM]), RDM is still a simple model to
       conceptualize.
     - RDM can be used to simultaneously ensure bandwidth efficiency
       and protection against QoS degradation of all Class-Types,
       whether preemption is used or not.
     - RDM can be used in conjunction with preemption to
       simultaneously achieve isolation across Class-Types (so that
       each Class-Type is guaranteed its share of bandwidth no
       matter the level of contention by other classes), bandwidth
       efficiency and protection against QoS degradation of all
       Class-Types.
     - RDM only requires limited protocol extensions such as the
       ones defined in [DSTE-PROTO].

RDM may not be attractive in some DS-TE environments for the
following reasons:
     - if the usage of preemption is precluded for some
       administrative reason, while RDM can still ensure bandwidth
       efficiency and protection against QoS degradation of all CTs,
       RDM cannot guarantee isolation across Class-Types.

Additional considerations on the properties of RDM can be found in
[BC-CONS] and [BC-MODEL].

As a simple example usage of the "Russian Doll" Bandwidth Constraints
Model, a network administrator using one CT for Voice (CT1) and one

```
  CT for data (CT0) might configure on a given link:
        - BC0 = Max-Reservable-Bw= 2.5 Gb/s (i.e. Voice + Data is
          limited to 2.5 Gb/s)
```

```
        - BC1= 1.5 Gb/s (i.e. Voice is limited to 1.5 Gb/s).
```

5. Example Formulas for Computing "Unreserved TE-Class [i]" with Russian Dolls Model

As specified in [DSTE-PROTO], formulas for computing "Unreserved TE-Class [i]" MUST reflect all of the Bandwidth Constraints relevant to the CT associated with TE-Class[i], and thus, depend on the Bandwidth Constraints Model. Thus, a DS-TE LSR implementing RDM MUST reflect the RDM bandwidth constraints defined in section 4 above when computing "Unreserved TE-Class [i]".

Keeping in mind, as explained in [DSTE-PROTO], that details of admission control algorithms as well as formulas for computing "Unreserved TE-Class [i]" are outside the scope of the IETF work, we provide in this section, for illustration purposes, an example of how values for the unreserved bandwidth for TE-Class[i] might be computed with RDM, assuming the basic admission control algorithm which simply deducts the exact bandwidth of any established LSP from all of the Bandwidth Constraints relevant to the CT associated with that LSP.

```
We assume that:
      TE-Class [i] <--> < CTc , preemption p>
in the configured TE-Class mapping.
```

For readability, formulas are first shown assuming only 3 CTs are active. The formulas are then extended to cover the cases where more CTs are used.

```
If CTc = CT0, then "Unreserved TE-Class [i]" =
      [ BC0 - SUM ( Reserved(CTb,q) ) ] for q <= p and 0 <= b <= 2

If CTc = CT1, then "Unreserved TE-Class [i]" =
      MIN  [
```

```
          [ BC1 - SUM ( Reserved(CTb,q) ) ] for q <= p and 1 <= b <= 2,
          [ BC0 - SUM ( Reserved(CTb,q) ) ] for q <= p and 0 <= b <= 2
                ]

   If CTc = CT2, then "Unreserved TE-Class [i]" =
          MIN  [
          [ BC2 - SUM ( Reserved(CTb,q) ) ] for q <= p and 2 <= b <= 2,
          [ BC1 - SUM ( Reserved(CTb,q) ) ] for q <= p and 1 <= b <= 2,
          [ BC0 - SUM ( Reserved(CTb,q) ) ] for q <= p and 0 <= b <= 2
                ]
```

   The formula can be generalized to 8 active CTs and expressed in a
   more compact way in the following:

```
    "Unreserved TE-Class [i]" =
     MIN  [
   [ BCc - SUM ( Reserved(CTb,q) ) ] for q <= p and c <= b <= 7,
   [ BC(c-1) - SUM ( Reserved(CTb,q) ) ] for q <= p and (c-1)<= b <= 7,
      . . .
   [ BC0 - SUM ( Reserved(CTb,q) ) ] for q <= p and 0 <= b <= 7,
          ]
     where:
       TE-Class [i] <--> < CTc , preemption p>
       in the configured TE-Class mapping.
```

[6](#). Receiving both Maximum Reservable Bandwidth and Bandwidth Constraints sub-TLVs

   [DSTE-PROTO] states that
   " A DS-TE LSR which does advertise Bandwidth Constraints MUST use the
   new "Bandwidth Constraints" sub-TLV (in addition to the existing
   Maximum Reservable Bandwidth sub-TLV) to do so."

   With RDM, BC0 is equal to the Maximum Reservable Bandwidth since they
   both represent the aggregate constraint across all Class-Types. Thus,
   a DS-TE LSR receiving both the "Maximum Reservable Bw" sub-TLV and

the new "Bandwidth Constraints" sub-TLV (which contains BC0) for a
given link where the RDM model is used, MAY ignore the "Maximum
Reservable Bw" sub-TLV.

7.   Security Considerations

Security considerations related to the use of DS-TE are discussed in
[DSTE-PROTO]. Those apply independently of the Bandwidth Constraints
model, including RDM specified in this document.

8.   Acknowledgments

We thank Martin Tatham for his key contribution in this work. Tatiana
Renko is also warmly thanked for her instantiation of the Russian
Doll.

Appendix A - Addressing [DSTE-REQ] Scenarios

   This Appendix provides examples of how the Russian Dolls Bandwidth
   Constraints model can be used to support each of the scenarios
   described in [DSTE-REQ].

1.   Scenario 1: Limiting Amount of Voice

   By configuring on every link:
        - Bandwidth Constraint 1 (for CT1=Voice) = "certain percentage"
          of link capacity
        - BC0 (for CT1=Voice + CT0= Data) = link capacity

   By configuring:
        - every CT1/Voice TE-LSP with preemption =0
        - every CT0/Data TE-LSP with preemption =1

   DS-TE with the Russian Dolls Model will address all the requirements:
        - amount of Voice traffic limited to desired percentage on
          every link
        - data traffic capable of using all remaining link capacity
        - voice traffic capable of preempting other traffic

2.   Scenario 2: Maintain Relative Proportion of Traffic Classes

   By configuring on every link:
        - BC2 (for CT2) = e.g. 45%
        - BC1 (for CT1+CT2) = e.g. 80%
        - BC0 (for CT0+CT1+CT2) = e.g.100%

   DS-TE with the Russian Dolls Model will ensure that the amount of
   traffic of each Class Type established on a link is within acceptable
   levels as compared to the resources allocated to the corresponding
   Diff-Serv PHBs regardless of which order the LSPs are routed in,
   regardless of which preemption priorities are used by which LSPs and
   regardless of failure situations.

   By also configuring:
        - every CT2/Voice TE-LSP with preemption =0

```
            - every CT1/Premium Data TE-LSP with preemption =1
            - every CT0/Best-Effort TE-LSP with preemption =2
```

DS-TE with the Russian Dolls Model will also ensure that:
```
            - CT2 Voice LSPs always have first preemption priority in order
              to use the CT2 capacity
            - CT1 Premium Data LSPs always have second preemption priority
              in order to use the CT1 capacity
            - Best-Effort can use up to link capacity whatever is left by
              CT2 and CT1.
```

Optional automatic adjustment of Diff-Serv scheduling configuration
could be used for maintaining very strict relationship between amount
of established traffic of each Class Type and corresponding Diff-Serv
resources.

3.   Scenario 3: Guaranteed Bandwidth Services

By configuring on every link:
```
            - BC1 (for CT1) = "given" percentage of link bandwidth
              (appropriate to achieve the Guaranteed Bandwidth service's
              QoS objectives)
            - BC0 (for CT0+CT1) = 100% of link bandwidth
```

DS-TE with the Russian Dolls Model will ensure that the amount of
Guaranteed Bandwidth Traffic established on every link remains below
the given percentage so that it will always meet its QoS objectives.
At the same time it will allow traffic engineering of the rest of the
traffic such that links can be filled up.
